1 General information

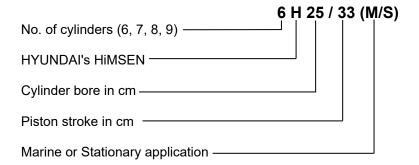

1.1 Introduction

This project guide provides necessary information and recommendations for the application of HYUNDAI HiMSEN H25/33 generating-set (gen-set). 'HiMSEN'® is the licensed brand name of HYUNDAI's own design engine and the abbreviation of 'Hi-Touch Marine & Stationary ENgine'. The HiMSEN H25/33 generating sets are delivered as complete packages, an engine and a generator are mounted on a common base frame together with related auxiliary equipment.

Please note that all data and information prepared in this project guide are for guidance only and subject to revision without notice. Therefore, please contact Hyundai Heavy Industries Co., Ltd. before actual applications of the data. Hyundai Heavy Industries Co., Ltd. (HHI) will always provide the data for the installation of specific project.

Each sheet is identified by the engine type and own 'Sheet Number'. Therefore, please use engine type 'H25/33', and 'Sheet No.' for easier communications.

2.2 Engine cross section

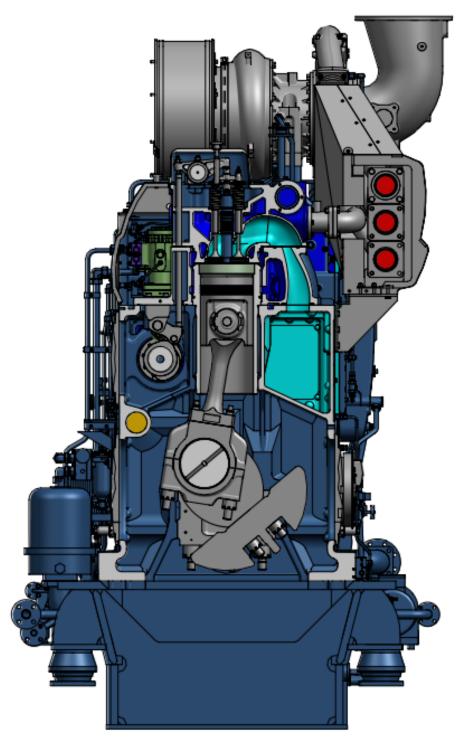

Figure 2.1 Engine cross section

2.3 Engine design outline

2.3.1 General

Hyundai engine 'HiMSEN H25/33' family have simple and smart design suitable for marine application with high reliability and performance. The key features are summarized as below:

- 1. Heavy fuel engine can be run with same fuel of main engine (Uni-fuel concept).
- 2. Eco-friendly and economical engine with the lowest fuel consumption and NO_X emission which are based on the following specific designs :
 - ✓ High stroke to bore ratio
 - ✓ High compression ratio
 - ✓ Optimized supercharging with miller cycle
 - ✓ High fuel injection pressure
- 3. Reliable and practical engine with simple, smart and robust structure.
 - ✓ A number of engine components are minimized with pipe-free design
 - ✓ Most of the components are directly accessible for easy maintenance.
 - ✓ Maintenance concept for each parts is to be provided
 - √ Feed system is fully modularized with direct accessibility
 - √ Highly integrated control system
 - ✓ Raven components are applied
 - ✓ Up-to-date technology is adopted.

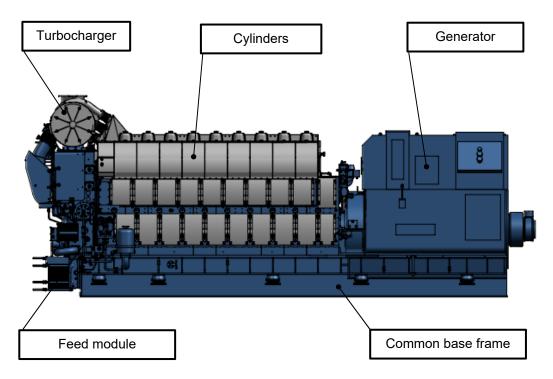

Figure 2.2 Engine design outline

2.3.2 Design of main components

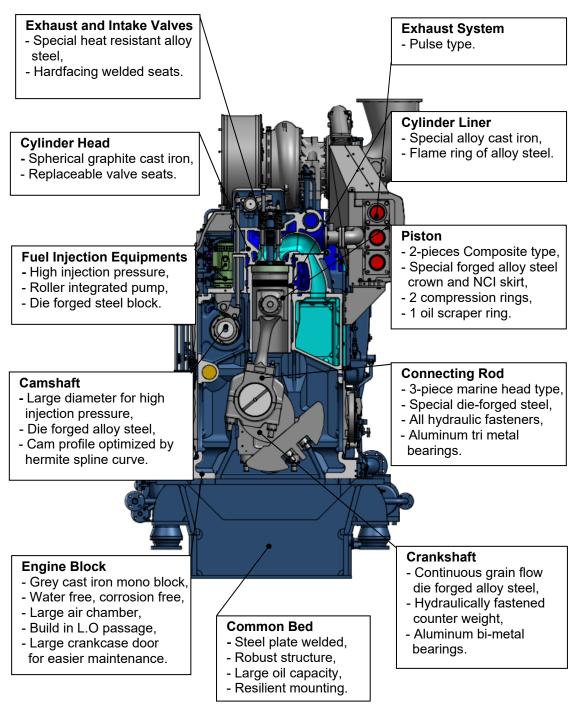

Figure 2.3 Cross section drawing

2.3.3 Description of feed module

HiMSEN has a unique design of feed module for better reliability and easy maintenance such as cooling water and lubricating oil system are fully modularized into the feed module with the following key features.

- ✓ All the components of the system, for example, pumps, valves, filters and coolers are mounted on feed block without any pipe connection, which provides direct accessibility with fewer parts for easy maintenance as shown below Figure 2.4.
- ✓ Feed block has cast-in flow channels for cooling water and lubricating oil circuits, which are arranged to secure water-tight to oil space and simplified in combination with pumps and valve housings for better flow characteristics to avoid any risk of corrosion due to cavitation.

Outline of feed module

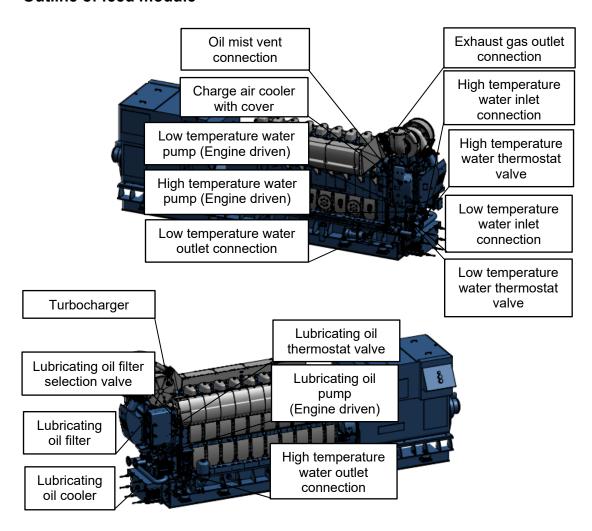

Figure 2.4 Outline of feed module

2.4 Generating-set dimension and weight

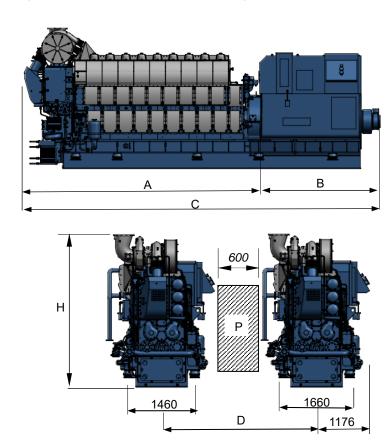

Table 2.2 Generating-set dimension and weight for 720 / 750 rpm

| Engine type | | Di | Dry weight (ton) ²⁾ | | | | |
|----------------|------|------|--------------------------------|------|------|-----------|-----------------------|
| | А | B 1) | C 1) | D | Н | Engine 3) | Generating -set 4) |
| 6H25/33 | 4414 | 2262 | 6676 | 2844 | 2961 | 20.2 | 29.8 |
| 7H25/33 | 4794 | 2262 | 7056 | 2844 | 2961 | 22.5 | 33.9 |
| 8H25/33 | 5311 | 2340 | 7651 | 2844 | 3241 | 24.1 | 39.5 |
| 9H25/33 | 5691 | 2262 | 7953 | 2844 | 3371 | 26.2 | 45.0 |

- 1. All dimensions and weight are approximate value and subject to change without prior notice.
- 1): Depending on alternator.
- 2): Weight including a standard alternator (Maker: HHI-EES)
- 3): Without common base frame
- 4) : With common base frame and generator
- D : Min. distance between engines
- P: Free passage between the engines, width 600 mm and height 2000 mm.

Table 2.3 Generating-set dimension and weight for 900 / 1000 rpm

| Engine | | Di | Dry weight (ton) 2) | | | | |
|---------|------|-----------------|---------------------|------|------|-----------|-----------------------|
| type | А | B ¹⁾ | C 1) | D | Н | Engine 3) | Generatin g-set 4) |

| 9H25/33 | 5691 | 2490 | 8181 | 2844 | 3371 | 26.2 | 45.0 |

- 1. All dimensions and weight are approximate value and subject to change without prior notice.
- Depending on alternator.
 Weight including a standard alternator (Maker : HHI-EES)
- 3): Without common base frame
- With common base frame and generator D: Min. distance between engines
- P: Free passage between the engines, width 600 mm and height 2,000 mm.

2.5 Mounting

2.5.1 General

The HiMSEN generating-set consists of diesel engine and alternator mounted on common base frame. The common base frame is installed on resilient mounts on the foundation in the ship.

The resilient mounting for the generating-set is made with a number of rubber elements in order to isolate from vibrations between generating-set and hull structure. These rubber elements are bolted to brackets of the common base frame as shown below Figure 2.5.

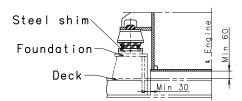

Figure 2.5 Resilient mounting

2.5.2 Design of resilient mount

The quantities and position of the resilient mount are determined by the dynamic characteristics of vessel. Therefore, the final specification of the resilient mount shall be decided based on the information from vessel contractor.

2.5.3 Connections to the generating-set

Generating-set mounted on resilient mount is usually influenced by a relative motions from the hull structure. Due to the reason, any rigid fixing between generating-set and hull structure causes damages to generating-set or hull. Therefore, all connections, for example, pipes, gratings, ladders, electric wires, etc., should be flexible enough to absorb the relative movements.

2.5.4 Recommendations for seating design and adjustment

The foundation for common base frame mounting should be rigid enough to support the load from generating-set. Steel shim plates with thickness of minimum 25 mm between rubber elements and foundation are required to adjust leveling of each mount (Method 1). Additional shim plate (Minimum thickness 10 mm) can be used for adjustments (Method 2) as shown below Figure 2.6. It is also recommended to check the crankshaft deflection before starting up the engine to secure the correct adjustments of the shim plate and leveling of the generating-set.

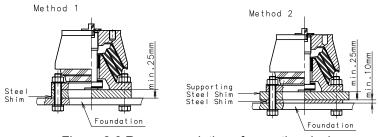

Figure 2.6 Recommendations for seating design

2.6 Overhaul dimension

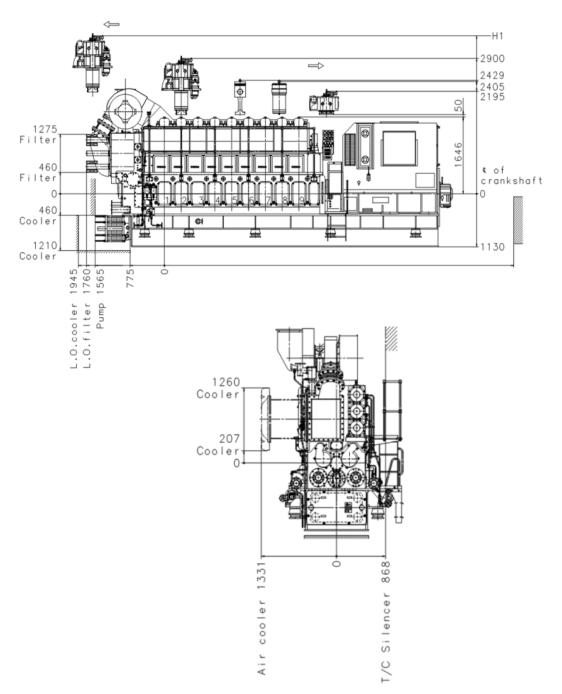

Figure 2.7 Overhaul dimension

Remark) H1 is overhaul height of the cylinder unit passing through the turbocharger.

H1 = 3044 mm, for 6H25/33, 7H25/33-720 rpm

H1 = 3380 mm, for 7H25/33-900 rpm, 8H25/33, 9H25/33

3 Performance data

3.1 Rated power for generating-set – Normal rating

Table 3.1 Rated power for generating-set – Normal rating

| | Rated output at | | | | | | | | | |
|----------------|-----------------|--------------------|-----------------|--------------------|-----------------|--------------------|------------------|--------------------|--|--|
| Engine type | 720 rpm | ı / 60 Hz | 750 rpm / 50 Hz | | 900 rpm / 60 Hz | | 1000 rpm / 50 Hz | | | |
| | Engine (kWm) | Generator (kWe) | Engine (kWm) | Generator (kWe) | Engine (kWm) | Generator (kWe) | Engine (kWm) | Generator (kWe) | | |
| 6H25/33 | 1440 | 1368 | 1500 | 1425 | 1800 | 1710 | 1800 | 1710 | | |
| 7H25/33 | 1680 | 1596 | 1750 | 1663 | 2100 | 1995 | 2100 | 1995 | | |
| 8H25/33 | 1920 | 1824 | 2000 | 1900 | 2400 | 2280 | 2400 | 2280 | | |
| 9H25/33 | 2160 | 2052 | 2250 | 2138 | 2700 | 2565 | 2700 | 2565 | | |

- 1. The permissible overload is 10 % for one hour every twelve hours.
- 2. The alternator outputs are calculated for an efficiency of 95 % and a power factor of 0.8 lagging.
- 3. Power adjusting of diesel engines must be consulted to engine builder.

Reference condition

General definition of diesel engine rating is specified in accordance with ISO 3046-1.

ISO condition

Turbocharger air inlet pressure : 1000 mbar Intake air temperature : 298 K (25 °C)

L.T cooling water temperature : 298 K (25 °C)

Tropical condition

Turbocharger air inlet pressure : 1000 mbar

Intake air temperature: 318 K (45°C)

L.T cooling water temperature : 309 K (36°C)

| Heavy fuel oil booster pump (8 bar at engine inlet, F1) ⁶⁾ | m³/h | 1.05 | 1.22 | 1.40 | 1.57 |

- 1) Under tropical condition(Turbocharger air inlet pressure 1 bar, intake air temperature 45°C, LT-cooling water temperature 36°C) with heat dissipation tolerance for coolers +10% / for heat recovery -15%.
- 2) Under ISO condition (ISO 3046-1:2002, Turbocharger air inlet pressure 1 bar, intake air temperature 25°C, LT- cooling water temperature 25°C) with flow tolerance ±10% and exhaust gas temperature tolerance ±25°C, these data are indicative values. For each project, please contact to HHI-EMD.
- 3) Additional heat for lube oil purification should be included. (30 kJ/kWh).
- 4) Flow capacity to be within a tolerance of 0 % to + 10 %.
- 5) Flushing oil quantity of automatic filter is included.
- 6) Heavy fuel oil booster pump head to be designed by external system designer considering pressure loss of external system.
- 7) Engine performance data depends on LCV (Low Calorific Value) of used fuel oil respectively, which influences fuel rack index of fuel injection pump.
- 8) This value includes Jet Assist System consumption. The air amount of jet assist for sudden load to be adjusted depending on the loading condition.

| Radiation | kJ/kWh | 91 | 82 | 86 | 102 | 131 | 324 | |
| 5. Specific fuel oil consumption ³⁾ | | | | | | | | |
| Specific fuel oil consumption | g/kWh | 181 | 180 | 180.3 | 181 | 187 | 211 | |

Remarks

Reference condition is based on ISO 3046-1:2002 (turbocharger air inlet pressure 1 bar, intake air temperature $25\,^{\circ}$ C, L.T cooling water temperature $25\,^{\circ}$ C) except heat balance data. For heat balance data, please see No. 2). The above values are based on IMO Tier II emission level without selective catalyst reduction operation.

1) Mass flow tolerance ± 5 %, temperature tolerance ± 25 °C (50 % < load ≤ 110 %). Mass flow tolerance ± 10 %, temperature tolerance ± 35 °C (Load ≤ 50%). For heat recovery, additional temperature tolerance - 10 °C should be accounted. When calculating heat dissipation for heat recovery based on the mass flow & temperature, the mass flow & temperature's tolerance should be considered.</p>

2) Reference condition is based on tropical condition (turbocharger air inlet pressure 1 bar, intake air temperature 45 °C, L.T cooling water temperature 36 °C).

Heat dissipation tolerance + 10 % for cooler, - 15 % for heat recovery.

Additional heat for lube oil purification should be included. (30 kJ/kWh).

3) Specific fuel oil consumption tolerance + 5 % at 100 % load.

Engine driven pumps detached : lubricating oil pump, high temperature cooling water pump, low temperature cooling water pump.

Specific fuel oil consumption excludes clean leakage fuel oil.

Fuel oil based on marine diesel oil, lower calorific value 42700 kJ/kg.

Specific fuel oil consumption is warranted at 100 % engine load without selective catalyst reduction operation.

Note) The value are only reference, the values can be modified.

Table 3.7 Engine performance data – Normal rating (Rated power : 250 kW / cylinder at 750 rpm)

| Performance data | Engine load (%) | | | | | | | |
|--|-----------------|-------|-------|-------|-------|-------|-------|--|

| Gas temperature after turbine | $^{\circ}$ | 332.6 | 341.5 | 354.8 | 363.7 | 385.9 | 408.1 | |
| 4. Heat balance data ²⁾ | | | | | | | | |
| Charge air | kJ/kWh | 1128 | 1077 | 1012 | 964 | 758 | 376 | |
| Lubricating oil | kJ/kWh | 628 | 620 | 649 | 719 | 870 | 1155 | |
| Jacket cooling water | kJ/kWh | 619 | 624 | 627 | 661 | 777 | 1300 | |
| Radiation | kJ/kWh | 91 | 82 | 86 | 102 | 131 | 325 | |
| 5. Specific fuel oil consumption ³⁾ | | | | | | | | |
| Specific fuel oil consumption | g/kWh | 181 | 180 | 180.3 | 181 | 187 | 211 | |

Reference condition is based on ISO 3046-1:2002 (turbocharger air inlet pressure 1 bar, intake air temperature 25°C, L.T cooling water temperature 25°C) except heat balance data. For heat balance data, please see No. 2). The above values are based on IMO Tier II emission level without selective catalyst reduction operation.

1) Mass flow tolerance \pm 5 %, temperature tolerance \pm 25 °C (50 % < load \leq 110 %). Mass flow tolerance \pm 10 %, temperature tolerance \pm 35 °C (Load \leq 50%).

For heat recovery, additional temperature tolerance - $10\,^{\circ}$ C should be accounted.

30/172

When calculating heat dissipation for heat recovery based on the mass flow & temperature,

the mass flow & temperature's tolerance should be considered.

2) Reference condition is based on tropical condition (turbocharger air inlet pressure 1 bar, intake air temperature 45 °C, L.T cooling water temperature 36 °C).

Heat dissipation tolerance + 10 % for cooler, - 15 % for heat recovery.

Additional heat for lube oil purification should be included. (30 kJ/kWh).

3) Specific fuel oil consumption tolerance + 5 % at 100 % load.

Engine driven pumps detached : lubricating oil pump, high temperature cooling water pump, low temperature cooling water pump.

Specific fuel oil consumption excludes clean leakage fuel oil.

Fuel oil based on marine diesel oil, lower calorific value 42700 kJ/kg.

Specific fuel oil consumption is warranted at 100 % engine load without selective catalyst reduction operation.

Note) The value are only reference, the values can be modified.

- 1. No overload operation is permissible except 10 % overload during official factory test.
- 2. The alternator outputs are calculated for an efficiency of 95 % and a power factor of 0.8 lagging.
- 3. Power adjusting of diesel engines must be consulted to engine builder.

Reference condition

General definition of diesel engine rating is specified in accordance with ISO 3046-1.

ISO condition

Turbocharger air inlet pressure : 1000 mbar Intake air temperature : 298 K (25 °C)

L.T cooling water temperature : 298 K (25 °C)

Tropical condition

Turbocharger air inlet pressure: 1000 mbar

Intake air temperature: 318 K (45°C)

L.T cooling water temperature : 309 K (36°C)

| | | | | | | | |

Remarks

Reference condition is based on ISO 3046-1:2002 (turbocharger air inlet pressure 1 bar, intake air temperature $25\,^{\circ}$ C) except heat balance data. For heat balance data, please see No. 2). The above values are based on IMO Tier II emission level without selective catalyst reduction operation.

1) Mass flow tolerance ± 5 %, temperature tolerance ± 25 °C (50 % < load ≤ 110 %). Mass flow tolerance ± 10 %, temperature tolerance ± 35 °C (Load ≤ 50%). For heat recovery, additional temperature tolerance - 10 °C should be accounted. When calculating heat dissipation for heat recovery based on the mass flow & temperature, the mass flow & temperature's tolerance should be considered.</p>

45/172 2nd Edit. Dec. 2024

2) Reference condition is based on tropical condition (turbocharger air inlet pressure 1 bar, intake air temperature 45 °C, L.T cooling water temperature 36 °C).

Heat dissipation tolerance + 10 % for cooler, - 15 % for heat recovery.

Additional heat for lube oil purification included (30 KJ/kWh).

3) Specific fuel oil consumption tolerance + 5 % at 100 % load.

Engine driven pumps detached : lubricating oil pump, high temperature cooling water pump, low temperature cooling water pump.

Specific fuel oil consumption excludes clean leakage fuel oil.

Fuel oil based on marine diesel oil, lower calorific value 42700 kJ/kg.

Specific fuel oil consumption is warranted at 100 % engine load without selective catalyst reduction operation.

4) Overload is only permissible during official shop tests.

Note) The value are only reference, the values can be modified.

| Radiation | kJ/kWh | 92 | 83 | 87 | 104 | 133 | 328 |
| 5. Specific fuel oil consumption | 3) | | | | | | |
| Specific fuel oil consumption | g/kWh | 183 | 182 | 182.3 | 183 | 189 | 213 |

Remarks

Reference condition is based on ISO 3046-1:2002 (turbocharger air inlet pressure 1 bar, intake air temperature 25°C, L.T cooling water temperature 25°C) except heat balance data. For heat balance data, please see No. 2). The above values are based on IMO Tier II emission level without selective catalyst reduction operation.

1) Mass flow tolerance ± 5 %, temperature tolerance ± 25 °C (50 % < load ≤ 110 %).

Mass flow tolerance \pm 10 %, temperature tolerance \pm 35 $^{\circ}$ C (Load \leq 50%).

For heat recovery, additional temperature tolerance - $10\,^{\circ}$ C should be accounted.

When calculating heat dissipation for heat recovery based on the mass flow & temperature,

the mass flow & temperature's tolerance should be considered.

2) Reference condition is based on tropical condition (turbocharger air inlet pressure 1 bar, intake air temperature 45 °C, L.T cooling water temperature 36 °C).

Heat dissipation tolerance + 10 % for cooler, - 15 % for heat recovery.

Additional heat for lube oil purification included (30 KJ/kWh).

HiMSEN H25/33 Project Guide

3) Specific fuel oil consumption tolerance + 5 % at 100 % load.

Engine driven pumps detached : lubricating oil pump, high temperature cooling water pump, low temperature cooling water pump.

Specific fuel oil consumption excludes clean leakage fuel oil.

Fuel oil based on marine diesel oil, lower calorific value 42700 kJ/kg.

Specific fuel oil consumption is warranted at 100 % engine load without selective catalyst reduction operation.

4) Overload is only permissible during official shop tests.

Note) The value are only reference, the values can be modified.

Table 3.17 Engine performance data – Higher rating (Rated power : 315 kW / cylinder at 900 rpm)

| Performance data | | | E | Engine load (% |) | |

3.7 Exhaust gas emission

3.7.1 General

HiMSEN H25/33 is designed for environment-friendly engine and complies with the IMO NO_X emission limits with low fuel consumption and less smoke.

Typical composition of exhaust gas emission in volume ratio at full load are as follows:

Table 3.19 Typical compositions of exhaust gas emission

| Typical exhaust compositions | Volume[%] |
|---|------------|
| Nitrogen, N ₂ | approx. 75 |
| Oxygen, O ₂ | арргох. 13 |
| Carbon Dioxide, CO ₂ | approx. 5 |
| Water (Vapor), H₂O | approx. 6 |
| Argon, Ar | approx. 1 |
| Soot, Ash, NO _X , CO, HC, etc. | residue |

Residue is little in amount but ecologically critical. Therefore, a careful attention on the treatment of fuel oil shall be required for engine operating conditions.

If there is no special requirements from customer regarding the exhaust gas emission, HiMSEN Generating-set shall be delivered with optimized performance conditions fulfilling the MARPOL 73/78 ANNEX VI, Regulation 13 of value of NO_X emissions.

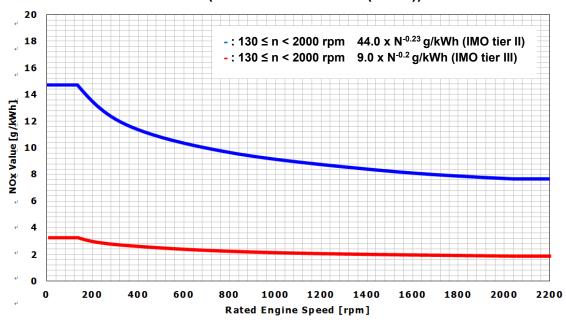

Therefore, it is strongly requested to contact the engine maker if there are any further requirements regarding exhaust gas emission or special operating conditions.

3.7.2 Engine international air pollution prevention (EIAPP) certificates

The Engine International Air Pollution Prevention (EIAPP) certificate is related to NOx emissions. If an engine complies with the NOx emission limits defined in regulation 13 of Annex VI, the EIAPP certificate with approved NOx technical file shall be issued by the administration or organization on behalf of the administration. Those are necessary for renewal of EIAPP certificate through the on-board NOx verification. The approved NOx technical file and EIAPP certificate shall accompany the engine throughout its life and shall be available at all times on the ship.

IMO tier II and tier III limits (MARPOL ANNEX VI (73/78))

 NO_X Emission from marine diesel engine test Cycle D2 In accordance with ISO 8178-4 and IMO NO_X technical code

Figure 3.9 IMO tier II and tier III limits

3.8 Power de-rating diagram

3.8.1 Diesel operation

De-rating due to Intake air temperature, cooling water temperature and altitude

Engine output power at maximum continuous rating shall be reduced depending on the intake air temperature, cooling water temperature and site altitude.

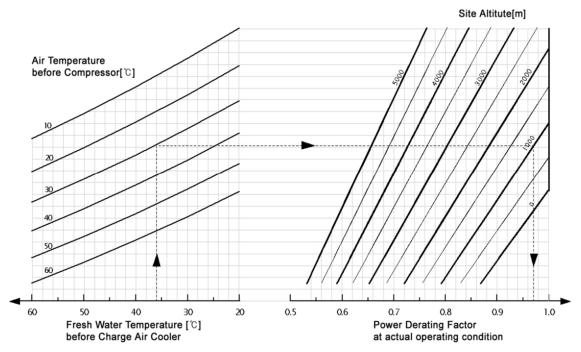

Figure 3.10 De-rating due to intake air temperature, cooling water temperature and altitude

Example

Cooling water temperature before charge air cooler : 36 °C

Intake air temperature : 30 °C

Site altitude: 1000 m

From the power de-rating diagram, the power de-rating factor at actual operating condition is 0.97. Therefore the engine output power at actual operating condition should be de-rated to the 97 % of the standard engine rated power.

55/172 2nd Edit. Dec. 2024

3.9 Correction of fuel oil consumption

3.9.1 Correction of ambient condition

Specific Fuel Oil Consumption (SFOC) is referred to the ISO 3046-1 standard condition in normally.

However, for the condition other than ISO 3046-1:2002 standard condition, the SFOC at maximum continuous rating can be estimated according to the below formula.

```
SFOC_{amb} = SFOC_{ISO} \times dSFOC \\ dSFOC = [100 + (T_{intake} - 25) \times 0.05 - (P_{amb} - 1000) \times 0.007 + (T_{cw} - 25) \times 0.07]/100 \times (42700 / LCV)
```

Where:

SFOC_{amb} (g/kWh) : Specific fuel oil consumption at actual operating condition SFOC_{ISO} (g/kWh) : Specific fuel oil consumption at ISO 3046-1 standard condition

T_{intake} (°C): Intake air temperature at actual operating condition

 $P_{\mbox{\tiny amb}}$ (mbar) : Turbocharger inlet air pressure at actual operating condition

 T_{cw} (°C): Cooling water temperature before charge air cooler at actual operating condition

LCV (kJ/kg): Lower calorific value of the fuel oil

Example,

Intake air temperature (T_{intake}): 30 °C, P_{amb}: 1000 (mbar)

Cooling water temperature (T_{cw}): 30 °C Lower calorific value (LCV): 42700 kJ/kg

 $\mbox{SFOC}_{\mbox{\tiny ISO}}$: 183 g/kWh at 720 rpm, maximum continuous rating

then, dSFOC = 1.006 and the SFOC at site condition will be increased to 184.1 g/kWh.

3.9.2 Clean leak fuel oil

Clean leak fuel oil (recycling fuel oil) during engine operation is subtracted from measured fuel oil consumption.

(Refer to 6.1 Internal fuel oil system)

FOCamb = FOC - clean leak fuel oil *)

*) The FOC and clean leak fuel oil (kg/h) are measured over minimum 10 mins.

3.9.3 Correction of additional fuel oil consumption

If additional devices are attached on the engine or operation fuel is changed, the specific fuel oil consumption at maximum continuous rating will be increased as follows approximately:

Table 3.20 Correction of additional fuel consumption

| Item | Additional SFOC [g/kWh] |
|--|-------------------------|
| Lubricating oil pump | + 2 |
| Low temperature cooling water pump. | + 1 |
| High temperature cooling water pump | + 1 |
| Fuel oil feed pump | Contact to HHI-EMD |
| Charge air pressure control device | Contact to HHI-EMD |
| Operation with marine gas oil | + 2 |
| 500 mm WC > Exhaust gas back pressure after turbine > 300 mmWC | + 0.5 / 100 mmWC |

When low and high temperature cooling water pump is attached on engine, Additional specific fuel oil consumption by water pump

= Additional specific fuel oil consumption at 100 % load ×
$$\left(\frac{100}{load}\right)^x$$
 × $\left(\frac{actual\ rpm}{nominal\ rpm}\right)^3 \frac{g}{kWh}$

When lubricating oil pump is attached on engine,

Additional specific fuel oil consumption by lubricating pump

= Additional specific fuel oil consumption at 100 % load ×
$$\left(\frac{100}{load}\right)^x$$
 × $\left(\frac{actual\ rpm}{nominal\ rpm}\right)$ $\frac{g}{kWh}$

Table 3.21 Additional specific fuel oil consumption of each load

| Load | 100 ~ 25 % | Under 25 % |
|------|------------|------------|
| x | 1.15 | 1.28 |

3.10 Correction of exhaust gas temperature

3.10.1 General

Correction for ambient condition

Exhaust gas temperature after turbine is referred to ISO 3046-1 standard condition in normally.

However, for the condition other than ISO 3046-1 standard condition, the exhaust gas temperature after turbine could be estimated according to the below formula:

$$\begin{split} T_{\text{exh.amb}} = & T_{\text{exh.ISO}} + dT_{\text{exh}} \\ dT_{\text{exh}} = & (T_{\text{intake}} - 25) \times 1.5 + (T_{\text{cw}} - 25) \times 0.7 \end{split}$$

where :

 $T_{\text{exh.amb}}$ (°C) : Exhaust gas temperature after turbine at actual operating condition

T_{exh,ISO} (°C): Exhaust gas temperature after turbine at ISO 3046-1 standard condition

dT_{exh} (°C): Deviation of the exhaust gas temperature after turbine

 T_{intake} (°C): Intake air temperature at actual operating condition

Example,

Intake air temperature ($T_{intake})$: 35 $\,^{\circ}\text{C}$

Cooling water temperature (T_{cw}) : 35 $\,^{\circ}$ C

T_{exh.ISO}: 290 °C at 720 rpm, maximum continuous rating

then, dT $_{\text{exg}}$ = 22 $\,^{\circ}\text{C}\,$ and the T $_{\text{exh.amb}}$ at actual operating condition will be increased to 312 $\,^{\circ}\text{C}.$

2nd Edit. Dec. 2024

¹⁾ Moment of Inertia : $GD^2 = 4 \times J \text{ (kgm}^2)$ 2) Recommended values, the case of different MOI should be confirmed by a torsional vibration analysis.

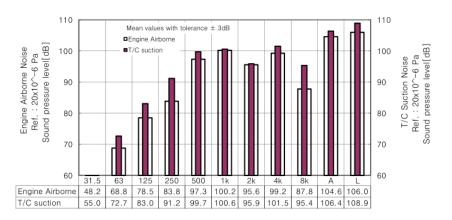

4.3 Noise measurement

4.3.1 General description

The airborne noise and air intake noise of the engine are defined as a sound pressure level according to ISO 6798 and ISO 8528-10. The total 19 point at distance 1 m away from the engine surface at full load should be measured. The values are averaged with A-weighting in one octave band.

In the octave level diagram, the minimum and maximum octave levels of all measuring points have been linked by results. The data can be changed, depending on the acoustical properties of the environment and the number of cylinder.

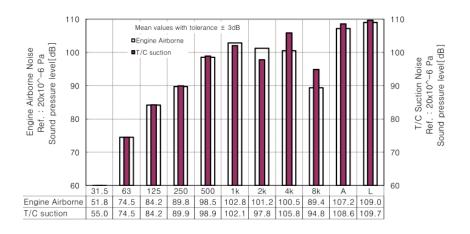

720 rpm (Diesel engine)

Octave band center frequency[Hz]

HYUNDAI HIMSEN

5 Operation and control system

5.1 Engine operation

5.1.1 General

HiMSEN is a heavy fuel engine and it is not necessary to change over to diesel fuel at any operating condition, for example, engine start, stop, low load running, etc.

However, there are some recommended to maintain good performance and reliability consistently.

5.1.2 Starting condition

Normal starting condition

Lubricating oil

- ✓ Continuous pre-lubrication is required
- ✓ Temperature : over 40 °C (Preheated)

Cylinder cooling water

- ✓ Start on marine diesel oil / marine gas oil : over 40 °C (Preheated)
- ✓ Start on heavy fuel oil : over 60 °C (Preheated)

Combustion air

✓ Intake air temperature : between 0 $^{\circ}$ C and 45 $^{\circ}$ C

Starting air

✓ Refer to the sheet '3.2 Engine capacity data - Normal rating and 3.5 Engine capacity data - Higher rating'.

Fuel oil (Marine diesel oil / marine gas oil or heavy fuel oil)

- ✓ Pre-circulation is required
- Engine inlet viscosity: 12 ~ 18 cSt (Heavy fuel oil)
 2 ~ 14 cSt (Marine diesel oil / marine gas oil)

Emergency cold starting condition

Fuel oil: only marine diesel oil / marine gas oil is acceptable

Cooling water : minimum 5 °C

2nd Edit. Dec. 2024

Lubricating oil: minimum 10 °C, pre-lubricated (Approx.1500 cSt based on SAE 40)

Intake air temperature : minimum 0 °C

5.1.3 Engine start

Engine start ready

Engine start ready condition is indicated in local and remote. It is recommended that engine is to be in warm condition before start.

Starter

- ✓ An air motor is installed in engine side and drives fly wheel through gears.
- ✓ The air motor is operated by compressed air and controlled by pneumatic solenoid valve. (See '9.1 Internal compressed air system')

Start block signals

- ✓ Turning gear engaged
- 'Blocking' switch 'on'
- ✓ Stop signal 'activated'
- ✓ Common shutdown
- ✓ Lubricating oil pressure at engine inlet low
- ✓ Tacho failure

5.1.4 Restriction for low load operation

Idle running

- ✓ Less than 5 minutes of idle running is permitted if the engine is going to stop.
- ✓ Maximum 30 minutes of idle running is permitted if the engine is loaded after idle running.

Long term low load operation

Marine diesel oil and marine gas oil operation

- ✓ Over 15 % load operation : no restriction
- ✓ Below 15 % load operation : load up over 70 % load at every limited time at corresponding load in Figure 5.1.

Heavy fuel oil operation

- ✓ Over 20 % load operation : no restriction
- ✓ Below 20 % load operation : load up over 70 % load at every limited time at corresponding load in Figure 5.1.

Duration of flushing operation (See 'Figure 5.1')

'Time limits for low load operation' (left) shows admissible operation time at certain load, and 'Duration of flushing operation' (right) shows. The required time for duration that engine operates at not less than 70 % of full load in order for burning the deposits away.

Example

- 1. Time limits for low load operation (line A, A')
 At 10 % of full load, heavy fuel oil operation is permissible for about 17 hours (line A),
 whereas marine diesel oil/marine gas oil operation for 37 hours. (line A').
- 2. Duration of flushing operation (line B, B')
 Engine should be operated for roughly 1.15 hours (heavy fuel oil) and 0.75 hours (marine diesel oil / marine gas oil) at not less than 70 % of full load.

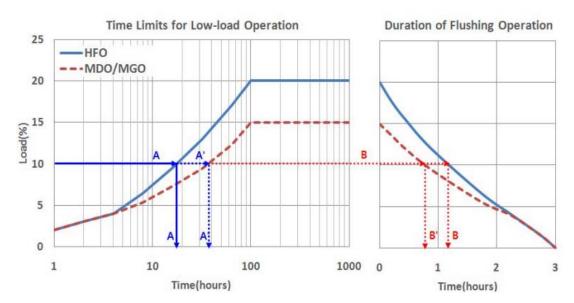

Figure 5.1 Time limits for low load operation

5.1.5 Engine load-up

HiMSEN engines fulfill all requirements regarding the load application of all major classification societies and IACS.

The engine has to be in warm condition for normal or emergency load up. When the engine is in cold condition, the continuous load up should be slower than normal and high step load should be prohibited.

Continuous load-up

The continuous load up capacity in engine condition is referred in Figure 5.2.

65/172

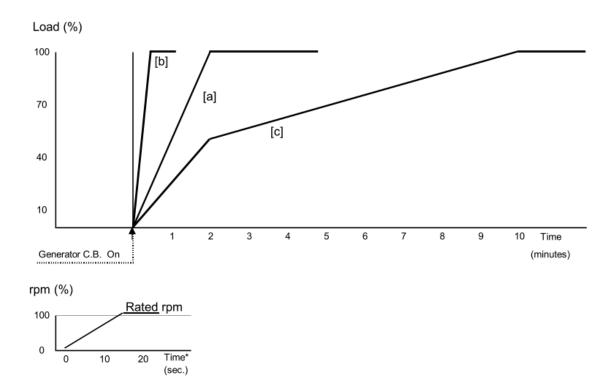

At warm condition, the 100 % load can be achieved in 2 min. by continuous ramping up at normal condition. At emergency condition, the load can be more quickly increased to 100 % in 30 sec.

2nd Edit. Dec. 2024

Step by step load-up

Considering the time and safety required for stabilizing the frequency due to sudden load up, it is recommended to load up from idle to full load by more than three steps under approval of classification society. HiMSEN generating-sets fulfill the requirements of classification societies concerning the frequency deviation and recovery time when loading up 3 steps from 0% to 100%.

^{*} The starting time may be subject to change and shall be informed separately for specific project.

Figure 5.2 Engine load up capacity in ramp

Curve [a]: Starting condition and load-up with warm(stand by) engine

- ✓ Continuous pre-lubricating is required
- ✓ Lubricating oil temperature : over 40 °C
- ✓ Jacket cooling water temperature : over 40 °C on marine diesel oil start
- ✓ Jacket cooling water temperature : over 60 °C on heavy fuel oil start
- ✓ Intake air (Compressor air inlet) temperature : between 0 °C and 45 °C
- ✓ Starting air pressure : refer to the sheet '3.2 Engine capacity data- Normal rating and 3.5 Engine capacity data Higher rating'.
- ✓ Fuel oil: marine diesel oil or heavy fuel oil

Curve [b]: Maximum capacity for quick starting and load-up with warm(stand by) engine

✓ Required same condition as curve [a]

Curve [c]: Stating condition and load-up with cold engine

- ✓ Continuous pre-lubricating is required
- ✓ Lubricating oil temperature : minimum 10 °C
- ✓ Jacket cooling water temperature : minimum 15 °C
- ✓ Intake air (Compressor air inlet) temperature : minimum 0 °C
- ✓ Starting air pressure : starting condition with warm engine + minimum 5 bar
- ✓ Fuel oil : only marine diesel oil acceptable

5.1.6 Engine stop

Two stop functions are applied to engine for safety reason.

Emergency stop

Emergency stop valve activates stop air cylinder at each fuel injection pump and governor stops the engine via fuel regulating shaft by stop solenoid valve simultaneously.

Normal stop

Governor stops the engine via fuel regulating shaft.

Stop signals

Both stoppers are activated by normal stop order by stop button or shut-down signals as below;

- ✓ Lubricating oil pressure switch 'Low'
- ✓ High temperature cooling water temperature switch 'High'
- ✓ Engine over speed rpm 'High'
- ✓ Emergency stop switch 'Operation'
- ✓ Bearing temperature switch 'High' (Option)
- ✓ Oil mist density 'High' (Option)
- ✓ Both engine speed sensors 'Fail'

5.1.7 Prelubrication system

Prelubricating oil pump

The pump unit is installed in engine side and supplies prelubricating oil to engine during either the engine stops or the engine's rpm level is below run state during engine starting.

5.2 Outline of engine automation

5.2.1 General

HiMSEN generating-sets provide automation system for engine safety, control and indicating based on programmable logic controller.

The system is independently installed in each engine and also can be connected to the remote system, for example main switch board of engine control room via hard wired communication cables.

In addition to fulfilling the requirements of all classification societies and IACS, the system provides more friendly features to customers.

For example,

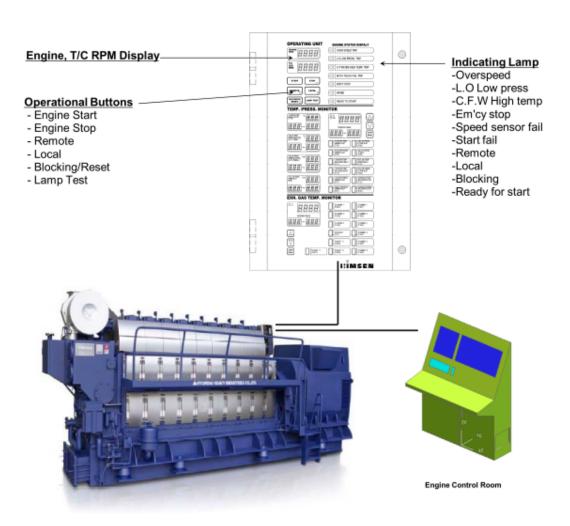

- ✓ Compact size and easy installation
- ✓ Digital display (Engine and Turbocharger rpm)
- ✓ Simple operation and no maintenance

5.2.2 System configuration

The system consists of the following sub systems.

Refer to Figure 5.3 for concept of sub system.

- ✓ Control (Start / Stop) and safety system
- ✓ Digital tachometer unit (Engine and turbocharger rpm)
- ✓ Indicating and switch unit
- ✓ Electronic instrumentation
- ✓ Local gauges
- ✓ Provision for external signal interface of yard's requirement

Reference diagram. The detail specification shall be decided at contract

Figure 5.3 HiMSEN engine control communication interface

5.3 Operation data and alarm points

Operation data of the engine is listed below table. Some data may be subject to change and shall be informed separately for specific project.

Table 5.1 Operation data of the engine

| System | Descriptions | Normal operation range at rated power | | Alarm and sensor | | | stop ngine |
|------------------|--|---|---|------------------|---------------|---------|--|

5.4 Hyundai intelligent Equipment Management Solution (HiEMS)

Introduction

HiEMS, offers a real-time engine status monitoring, troubleshooting guidance to marine engineers and provides connectivity between engines and on shore monitoring center.

With HiEMS, HiMSEN customers can get our experts of engine and service close to you.

With intuitive UI, engine operators can figure out the root cause of a certain alarm and get the technical advice and troubleshooting guide. When detecting the abnormalities in engine, HiEMS transfers alarm/fault information and sensor data to onshore for the detail analysis.

Also, HiEMS keeps long term data for fleet and engine managements.

Benefits

On Ship

HiEMS provides guidance for the engine operator, maintenance function with engineering based instruction guide and integrated trouble shooting guide, which enables engine operators to run and maintain HiMSEN Engine at optimal condition.

On Shore

Ship managers can manage the fleet of HiMSEN engines with HiEMS, accessible 24*7 through the Digital Innovation (DI) center of HGS (Hyundai Global Service).

Ship managers can get real-time remote diagnostics, qualified advices and services from our engineers and service experts. (On reporting service version)

Main features

On Ship

Real-time status monitoring of the HiMSEN engine

✓ Status of the engine, indicator of sub systems, trend and surveillance with FAT.

Analysis tools for engine data

✓ Performance, deviation, correlation analysis and statistics.

Maintenance and guidance based on the instruction guide

✓ Alarm manager, maintenance manager, wearing parts manager.

On Shore

Status monitoring of the fleet of HiMSEN engines

- ✓ Overall status of alarm and running hour.
- ✓ Long term data management and reporting service.

73/172 2nd Edit, Dec. 2024

License policy

Standard version

All main features for "On ship" is available, data of a specific time interval is sent to on shore, such as alarm, statistics and operational data.

Reporting service version

Including "Standard version" features, regular reporting service is available through Hyundai Global Service (HGS).

Contact Hyundai Global Service (HGS) for reporting service.

| No | Description | Remark |
|----|---------------------|--------|
| 3 | Fuel injection pump | |
| 4 | Governor | |

6.1.1 General description

Fuel system for the diesel engine is designed for a reliable combustion of heavy fuel oil as well as diesel fuel oil. Therefore, it is not recommended to change over the fuels except for the cold starting, flushing of the system, maintenance or long term stand still.

Fuel oil system

The fuel oil injection equipment comprises an injection pump, connection block, injection pipe and injection valve, which are installed on each cylinder. The system is designed for operating the high pressure of the fuel injection with better combustion.

The amount of fuel injection is controlled by governor via the common regulating shaft and spring loaded linkage, which maintains the engine speed at the preset-value by continuous positioning of the fuel pump rack.

The clean leak oil from each injection pump, high pressure connection block, etc. is drained and collected to the recycling fuel oil leakage alarm tank. It can be recycled without additional separation process. Recycling fuel oil leakage alarm tank is a modularized box for the external connections, which provides:

- ✓ Connections for fuel oil return pipes 25A
- ✓ Connection for a recycling drain pipe 15A
- ✓ Alarm switch and tank for excessive leakage

The dirty leak oil is collected to the common drain pipe led to the sludge tank. The total leak rate of fuel oil is $0.30 \times C_f^{1)}$ liter / cylinder hour (Tolerance $\pm 50 \%$). The recycling fuel oil can be led to external tank to be reused.

1) C_f : Heavy fuel oil = 0.5, Marine diesel oil = 1.0, Marine gas oil = 2.0

Option

Fuel oil safety filter can be mounted on request as an option.

6.2 External fuel oil system

2nd Edit. Dec. 2024

Additional day tanks for low sulfur heavy fuel oil and / or marine diesel oil could be required due to IMO MARPOL Annex VI, a special notation of classification societies, a local regulation, or other reasons.
 This heavy fuel oil system is only for guidance for generator engines. All external piping design and system arrangement

should be designed by shipbuilder in accordance to the classification rules and building specifications.

6.2.1 General requirements

The external fuel system for the auxiliary engines can be a common with main engine system or an independent system depending on the shipbuilder's choice.

In any cases, the condition of fuel oil, especially heavy fuel oil, is critical for the reliable operation of the engine. The most important conditions and requirements of the external fuel oil system are described as follows:

Well cleaned fuel

Solid particles and water in the fuel cause over wearing and frequent maintenance for the engine itself as well as external fuel system. Therefore, the proper and reliable separation equipment should be included in the external fuel oil system not only for heavy fuel oil but also for distillate fuel.

Proper viscosity, temperature, pressure

The appropriate viscosity, temperature and pressure are necessary. Therefore, preheating, insulation with heat tracing, and pressurizing equipment should be included in the external fuel oil system. Especially if the fuel is at low viscosity, fuel temperature should be controlled to meet the required viscosity by fuel cooling device such as cooler unit.

In order to prevent excessive pressure losses and also to minimize possible pressure pulses in the piping system, the fuel oil velocity should not exceed :

✓ Marine diesel oil suction pipe
 ✓ Marine diesel oil pressure pipe
 ✓ Heavy fuel oil suction pipe
 ✓ Heavy fuel oil pressure pipe
 ∴ 0.5 ~ 1.0 m/s
 ∴ 1.5 ~ 2.0 m/s
 ∴ 0.3 ~ 0.8 m/s
 ✓ Heavy fuel oil pressure pipe
 ∴ 0.5 ~ 1.2 m/s

Marine diesel fuel oil

Diesel fuel oil system is necessary to back up (especially for emergency situations) and, it is also used for flushing before engine stop for long period standstill and in the event of major overhaul.

External fuel oil system

Normally the external fuel system comprises the fuel treatment system and fuel feed system. General requirements described on next section and more detailed information can be provided if needed for specific vessel or plant.

Fuel oil treatment system

The fuel treatment system should be designed for proper cleaning of heavy fuel oil considering total fuel consumption of the vessel. Centrifugal separators should be an automatic type with the same additional stand-by unit. The separator should be capable of purifying the worst grade of the fuel oil. Normally, the fuel oil grade of H380 to H700 requires the capability of up to 1010 kg/m².

For distillate fuel, an independent purifier system is required.

It is necessary to ensure a proper cleaning of heavy fuel oil as follows:

- ✓ Selection and operation of fuel oil centrifuges according to supplier's recommendation
- ✓ Correct heavy fuel oil temperature at inlet to centrifuges
 (The centrifuges should be always operated with an inlet temperature of 98 °C for heavy fuel oil)
- ✓ Correct throughput of fuel oil through centrifuges

$$Q = \frac{P x b x 24(h)}{p x t}$$

P = maximum continuous output of the engine(s) [kW]

b = specific fuel consumption + safety margin (15 %) [g/kWh]

p = density of the fuel [kg/m³]

t = daily separating time(h) (usually = 23 h or 23.5 h)

- ✓ Proper density of heavy fuel oil in conformance with centrifuge specification
- ✓ Proper maintenance of centrifuges

The centrifuges should be operated in parallel, unless the centrifuge installation comprises manually operated centrifuges, with the purifier followed by the clarifier. To achieve the maximum separation efficiency, it is recommended to always use all available heavy fuel oil centrifuges whenever possible, and to operate them in parallel with an adjusted feed rate lowering the throughput in the centrifuges. This will ensure the longest possible retention time in the centrifuges and optimal efficiency for removal of catalytic fines.

It is important that maintenance and operation of the centrifuge is done according to the recommendations of the manufacturer.

The required capacity of the daily (service) tank and the settling tank for heavy fuel oil is minimum 24 operating hours feed for continuous full load operation. Each tank should be heated to have stable temperature between $50 \sim 70 \, ^{\circ}$ C. Each tank should be equipped with effective sludge and water drain system.

6.2.2 Fuel feed system

The fuel feed system can be common with other engines. The one of the most important is the proper control of the fuel viscosity. So the fuel feed system should have appropriated heating equipment and insulation accordingly. In addition, the fuel oil should be pressurized to avoid the gas separation due to high temperature.

Day tank for heavy fuel oil

The heavy fuel day tank should be filled with cleaned fuel by continuous fuel separation.

- ✓ Tank capacity : minimum 24 operating hours feed for full load operation.
- ✓ Tank heating : approx. 75 °C, as stable as possible.
- ✓ Sludge / water space and drain provided.

Heavy fuel oil / marine diesel oil changeover valve

The heavy fuel oil and marine diesel oil changeover valves should be installed before the supply pump and the cooler for fuel oil outlet respectively. The valve can be a manual type or an electro-pneumatic remote control type for the flexible fuel mode selection at any load conditions.

Suction strainer

To protect the supply pump, a suction strainer with a fineness of approx. 0.5 mm with magnet should be installed on the pump suction side.

Supply pump

 Capacity: min. 1.5 x total fuel consumption at maximum continuous rating + back flushing quantity

✓ Pump head : 4 bar

✓ Operating temperature : 100 °C

✓ Viscosity (for electric motor): 1000 cSt

Flow meter

If a measuring device for fuel oil consumption is required, it has to be fitted between the supply pump and the mixing tank.

A by-pass line has to be installed in parallel with the flow meter to ensure the fuel oil supply free from possible clogging.

Mixing tank

The major purpose of mixing tank is to ensure the ventilation of the gas from the hot fuel oil and a gradual temperature balance by mixing the hot returned oil from the engine with the oil from the day tank.

The volume of mixing is tank is required not less than 100 liters.

Pressure control valve

The pressure control valves maintain constant system pressure. The surplus oil return to the supply pump suction side or to the fuel oil return line.

Booster pump

Since the heated fuel oil has to be continuously recirculated, the booster pump should ensure the fuel circulation with the required pressure in the system.

 Capacity: min. 3.0 x total fuel consumption at maximum continuous rating + back flushing quantity

✓ Pump head : 8 bar at Fuel oil inlet, F1

✓ Operating temperature : 150 °C

√ Viscosity (for electric motor): 500 cSt

Heater and viscosity controller

In order to ensure the correct injection viscosity at $12 \sim 18$ cSt (HFO), the dual heaters are controlled by the viscosity controller.

Each heater should have sufficient capacity for heating the fuel oil for all engines at full load, one heater can therefore be overhauled while the other one is in service.

Auto back flushing filter

In the circulating lines, absolute 10 μ m automatic back-flushing filter must be installed before the branch pipe for each engine to ensure the cleanness of the fuel oil. If the cleaning cycles of the automatic back-flushing filter are increased, the fuel oil treatment system must be optimized in order to protect the engine.

Safety filter

Fuel oil safety filter, duplex type of absolute 50 μ m, to be built in the fuel oil supply line of each engine.

Drain tank for dirty oil

The dirty leak oil from the engine is drained by gravity and collected to the drain tank for dirty oil, where heating coils are required. The drain tank should be transferred to the sludge tank.

Marine diesel oil feed system

Even for the heavy fuel oil engine, an independent marine diesel oil feed system is required for the cases as below;

- ✓ Long time low load operation or stop
- ✓ Maintenance of heavy fuel oil system
- ✓ Emergency situation such as a black-out.

85/172

Emergency start

In emergency situation such as black out, marine diesel oil must be supplied to start up stand-by engines with a sufficient fuel oil pressure, which can be supplied by emergency booster pump or a gravity tank which is located minimum 8 m above the engine.

2nd Edit. Dec. 2024

6.3 Fuel oil specification

The fuel oil specifications are based on ISO 8217: 2017. The fuel is largely classified into two categories as distillate fuels and residual fuels. Distillate fuels are categorized into DMX, DMA, DFA, DMZ, DFZ, DMB, and DFB. Residual fuels are categorized into RMA 10, RMB 30, RMD 80, RME 180, RMG 180 to 700, RMK 380 to 700. The usage of DMX is restricted by SOLAS requirement due to its low flash point.

The terminologies of marine fuel oil to be called after 1st January 2020 have been determined as below Table 6.5. In accordance with the most relevant characteristics.

HiMSEN is able to operate with all fuels specified in the below table. The simplified terminologies listed in Table 6.5 allows easy determination if the fuel can be applicable for HiMSEN.

Table 6.5 Designation of fuel grades

| | Fuel grade | Sulfur content (%) | | cosity (cSt) residual fuels for distillate els) Maximum | ISO 8217 : 2017 | |
|-------------------------------|--------------------------------------|------------------------------------|------------------------------|---|--|--|
| HSFO (High sulfur fuel oil | | $1.0 < S \le 3.5$ (or even higher) | 10 | 700 | Residual marine fuels | |
| HFO (Heave) | LSFO (Low sulfur fuel oil) | $0.5 < S \le 1.0$ | 10 | 700 | (RMB, RMD, RME, RMG, RMK) | |
| (Heavy fuel oil) | VLSFO (Very low sulfur fuel oil) | $0.1 < S \le 0.5$ | 2 ~ 380 (Not decided yet) | | Not defined | |
| | ULSFO (Ultra low sulfur fuel oil) | S ≤ 0.1 | 9 ~ 67 (Not decided yet) | | | |
| MGO (Marine gas oil) | | S ≤ 1.0 | 2 | 6 | Distilled marine fuels (DMA, DFA, DMZ, DFZ) | |
| MDO (Marine diesel oil) | | 1 5 < 15 | | 11 | Distillate marine fuels (DMB, DFB) Residual marine fuels (RMA 10) | |

- a) $1 \text{ mm}^2/\text{s} = 1 \text{ cSt}$
- b) Notwithstanding the limits given, a purchaser shall define the maximum sulfur content in accordance with relevant statutory limitations. See introduction of ISO 8217 : 2017.
- lf the sample is not clear and bright, the total sediment by hot filtration and water tests shall be required. See 6.8 and 6.12 of ISO 8217 : 2017.
- d) If the sample is not clear and bright, the test cannot be undertaken and therefore, compliance with this limit cannot be shown.
- e) See 5.1 and Annex A of ISO 8217: 2017
- Pour point cannot guarantee operability for all ships in all climates. The purchaser should confirm that the cold flow characteristics (pour point, cold filter plugging point) are suitable for the ship's design and intended voyage. See 6.11 of ISO 8217: 2017.
- g) If the sample is dyed and not transparent, then the water limit and test method as given in 6.12 of ISO 8217: 2017 shall apply.
- h) This requirement is applicable to fuels with a sulfur content below 500 mg/kg (0.050 mass %).

2nd Edit. Dec. 2024

b) The purchaser shall define the maximum sulfur content in accordance with relevant statutory limitations.

c) See Annex H of ISO 8217 : 2017.

d) The purchaser should confirm that this pour point is suitable of the ship's intended area of operation.

^{*)} International statutory requirements

This document specifies allowable minimum flash point limits following the provisions given in the SOLAS convention. MARPOL Annex VI, which controls air pollution from ships, includes a requirement that either the fuel shall not exceed a specified maximum sulfur or an approved equivalent alternative means be used. During the lifetime of this document, regional and/or national bodies may introduce their own local emission requirements, which can impact the allowable sulfur content, for example, the EU sulfur directive. It is the purchaser's and the user's responsibility to establish which statutory requirements are to be met and specify on that basis the corresponding maximum fuel sulfur content to the supplier.

a) $1 \text{ mm}^2/\text{s} = 1 \text{ cSt}$

*) International statutory requirements
This document specifies allowable minimum flash point limits following the provisions given in the SOLAS convention. MARPOL Annex VI, which controls air pollution from ships, includes a requirement that either the fuel shall not exceed a specified maximum sulfur or an approved equivalent alternative means be used. During the lifetime of this document, regional and/or national bodies may introduce their own local emission requirements, which can impact the allowable sulfur content, for example, the EU sulfur directive. It is the purchaser's and the user's responsibility to establish which statutory requirements are to be met and specify on that basis the corresponding maximum fuel sulfur content to the supplier.

b) The purchaser shall define the maximum sulfur content in accordance with relevant statutory limitations.

c) See Annex H of ISO 8217 : 2017.

d) The purchaser should confirm that this pour point is suitable of the ship's intended area of operation.

Biofuels

Biofuels are largely classified into 3 categories as transesterified biofuels(biodiesel), bio-blends and others. (Classify biofuels with or without International standard)

- ✓ Transesterified Biofuels (International standards EN 14214 or ASTM D 6751-19)
 ex) Biodiesel (Fatty Acid Methyl Ester FAME)
- ✓ HVO (Hydrotreated Vegetable Oil) (International standards EN 15940, Paraffinic Diesel Fuel from Hydrotreatment)
- ✓ Bio-blends (Mixture of Biofuels and Fossil fuels)
- ✓ Other biofuels
 ex) Crude biofuels (Palm oils, Vegetable oil, Animal fat), Refined biofuels, etc.

HiMSEN is able to operate continuously with biofuels specified in the below Table 6.8 and Table 6.9

✓ When using biofuels included in quality standards Table 6.8 and Table 6.9, you need to get confirmation from HiMSEN.

Biodiesel / Fatty Acid Methyl Ester (FAME)

Biodiesel (FAME) is derived from Crude biofuels by using transesterification processes. It can be used alone or blended with petro-diesel in any proportions.

International standards EN 14214 or ASTM D 6751-19 are commonly used to specify the quality of biodiesel. (See the Table 6.8)

Table 6.8 Specifications of biodiesel(FAME)

| Characteristics b) | Unit | Min. limit | Max. limit | Test method reference |

| Group II metals (Ca+Mg) | mg/kg | - | 5 | EN 14538 |
| Phosphorus content | mg/kg | - | 4 | EN14107 |

a) The temperatures related to filterability have to be at least 10~15°C above the minimum fuel oil temperature (maximum temperature among cloud point, pour point, CFPP, and LTFT) in the whole fuel treatment process, even during engine stop unless flushing using pure diesel oil were performed before engine stop.

Hydrotreated Vegetable Oil (HVO)

The EN 15940:2016 + A1:2018 + AC:2019 standard covers hydrotreated paraffinic renewable diesel fuel and synthetic Fischer-Tropsch products GTL, BTL and Coal-to-Liquid (CTL).

Since HVO consists of paraffinic hydrocarbons, it cannot meet the requirements set by EN 14214:2013+ A2:2019, which is a standard developed and valid only for methyl ester chemistry type biodiesel, namely FAME. As a matter of fact, HVO meets EN 590, except the requirement for minimum density. International standards EN 15940 are commonly used to specify the quality of HVO. (See the Table 6.8)

b) The information of storage and deterioration of Biodiesel regarding EN14214 should be discussed/checked by fuel oil supplier before biodiesel is applied to engine.

Table 6.9 Specifications of HVO(EN15940)

| Characteristics | Unit | Min. limit | Max. limit | Test method reference |

a) The temperatures related to filterability have to be at least 10~15℃ above the minimum fuel oil temperature (maximum temperature among cloud point, pour point, CFPP, and LTFT) in the whole fuel treatment process, even during engine stop unless flushing using pure diesel oil were performed before engine stop.

2nd Edit. Dec. 2024

Bio-blends

Bio-blends are mixture of biofuels and fossil fuels.

The volume ratio of the biofuel in the bio-blends are referred to as follows.

✓ B##, BD## (## : the volume ratio of the biofuel in the bio-blends)
 ex) BD20 = Biodiesel 20% + Distillate marine fuels 80%
 (In the case of Biodiesel mixture, it is specially referred to as BD##)
 B20 = Biofuel 20% + Fossil fuel 80%
 (Except for Biodiesel mixture, the other bio-blends are referred to as B##)

The quality standards of biodiesel-blends(BD##) are referred to the Table 6.8 and the bioblends(B##) except for biodiesel-blends(BD##) are referred to the Table 6.10.

General biofuels

The quality standards of general liquid biofuels except biodiesel(FAME) are as shown below Table 6.10.(General biofuels include a wide range of specifications. In order to reduce confusion when applying biofuel standards, HiMSEN set the integrated standard with the Table 6.10.) Only biofuels that meet EN14214 or EN15940 can be applied to Micro-Pilot (MP) injector. The information of storage and deterioration of biofuels should be discussed/checked by fuel oil supplier before the biofuel is applied to engine.

Table 6.10 Specifications of general biofuel, bio-blends.

- a) The temperatures related to filterability have to be at least 10~15°C above the minimum fuel oil temperature (maximum temperature among cloud point, pour point, CFPP, and LTFT) in the whole fuel treatment process, even during engine stop unless flushing using pure diesel oil were performed before engine stop.
- b) It is required the agreement of FIP maker and HHI if the total acid number is more than 2.5 mg KOH/g.
- c) Aluminium and Silicon contents shall be less than 10 ppm at engine inlet although those contents is required less than 60 mg/kg in fuel oil.
- d) It is required the agreement of SCR maker if the project is required the SCR with engine.

6.4 Fuel oil viscosity diagram

The viscosity of heavy fuel oil to the engine should be kept within the value of $12 \sim 18$ cSt. However, the viscosity varies depending on the properties and the temperature of the fuel oil. Maximum preheating temperature of heavy fuel oil is limited up to 155 °C to avoid the vaporization of the fuel oil. A typical fuel oil viscosity diagram with temperature is as follows:

^{1.} The viscosity of marine diesel oil / marine gas oil to the engine should be kept within the value of 2 ~ 14 cSt in order to avoid possible sticking of fuel injection pump due to low lubricity of marine diesel oil / marine gas oil.

Figure 6.4 Diagram for fuel oil viscosity

97/172 2nd Edit. Dec. 2024

6.5 Fuel oil quality

6.5.1 Fuel characteristics

Viscosity

The viscosity of fuel oil to the engine should be kept within the value of $12 \sim 18$ cSt for heavy fuel oil and $3 \sim 14$ cSt for marine diesel oil / marine gas oil, which could be achieved by proper heating recommended by fuel supplier as the viscosity varies depending on the properties of the fuel oil.

Density

If the density of the fuel oil is over the maximum density (991 kg/m³ at 15 °C), the fuel oil is hard to be used because it is highly expected to be contaminated by water or solid unfiltered from system. The special centrifuging system should be installed for the fuel oil with the maximum density (1010 kg/m³ at 15 °C).

Sulfur

It is important to keep proper sulfur contents in the fuel oil. The high sulfur content in the fuel may increase the risk of low temperature corrosion in the combustion chamber and contribute to the formation of high temperature deposit. It is also recommended to keep the proper alkalinity of the lubricating oil for neutralizing.

Ash

The ash content comes from natural crude oil and also from contamination during treatment of the fuel. The solid ingredients can be removed mostly by centrifuging of the fuel. However there are soluble compounds such as vanadium and sodium, which can be transformed as ash after combustion. As the ash in any form promotes mechanical wear of engine parts and harmful deposits in the combustion chamber, the ash components should be carefully analyzed and removed in advance.

Vanadium and sodium

Vanadium is oil – soluble and comes from crude oil mostly. However sodium is water-soluble and comes from crude oil as well as contaminated fuel by salt water. As vanadium and sodium become corrosive ash after combustion, these should be removed as possible. A sodium compound contributes to lower the melting point of vanadium ash, which is very corrosive and harmful to exhaust valves and turbocharger. Therefore, compounds should be less than 1/3 of vanadium contents in weight.

Conradson carbon

Including much conradson carbon may impair combustion properties of the fuel and cause deposit formation in combustion chamber and exhaust system particularly at low engine output.

Asphaltenes

High asphaltene contents shall contribute to forming of deposit in combustion chamber as well as exhaust system at low loads and stick the fuel injection pump. It also causes excessive centrifuge sludge and deposits in the fuel system.

Water

The water contents can be measured by a standardized distillation test. The water causes corrosion and cavitation of the fuel injection pump and fouling of the exhaust system and turbochargers. The water content should be reduced to maximum 0.2 % by centrifuging.

Abrasive particles

Fuel oil can be contaminated by abrasive particles composed of aluminium and silicon. If the efficient fuel treatment is not applied, these fine catalysts can cause abnormal wear on injection system and cylinder liners / piston rings. The aluminum and silicon should be reduced to maximum 15 mg/kg before engine inlet.

6.5.2 Ignition quality

The ignition quality is related to the ignition delay to the intervals between fuel injection and combustion. If the engine is operated at low load or in the condition of low temperature or pressure in the combustion chamber, the ignition delay is lengthened. During the initial operation, the engine can be damaged by the low ignition quality without sufficient preheating. The equation of CCAI (Calculated Carbon Aromaticity Index) developed by Shell can be used to get the ignition quality of the heavy fuel oil.

Calculated carbon aromaticity index

```
CCAI = D - 81 - 141 \times log \times [log \times (Vk + 0.85)]
```

Where:

D (kg/m $^{\circ}$ at 15 $^{\circ}$ C) = Density Vk (cSt at 50 $^{\circ}$ C) = Viscosity

If the value of CCAI is increased, the ignition quality has decreased value. The fuel oil with high CCAI value can cause a combustion problem.

To prevent any troubles about poor ignition quality, engine should be preheated sufficiently before start and has proper functions of cooling system and injection system.

From light distillates to residual fuels, net and gross specific energy can be tested or calculated according to various international standards. Basically, the specific energy value provided by fuel supplier is adapted for the determination of the heat of combustion.

If it is not supplied from fuel supplier, it can be calculated by the specification of other properties as the equations given below.

For residual fuels,

$$\begin{split} N &= (46.704 - 8.802 \times \rho^2 \times 10^{-6} + 3.167 \times \rho \times 10^{-3}) \times [1 - 0.01 \times (w + a + s)] + 0.0942 \times s - 0.02449 \times w \\ G &= (52.190 - 8.802 \times \rho^2 \times 10^{-6}) \times [1 - 0.01 \times (w + a + s)] + 0.0942 \times s \end{split}$$

For marine distillate fuels,

$$\begin{split} N &= (46.423 - 8.792 \times \rho^2 \times 10^{-6} + 3.170 \times \rho \times 10^{-3}) \times [1 - 0.01 \times (w + a + s)] + 0.0942 \times s - 0.02449 \times w \\ G &= (51.916 - 8.792 \times \rho^2 \times 10^{-6}) \times [1 - 0.01 \times (w + a + s)] + 0.0942 \times s \end{split}$$

Where:

```
N (MJ/kg) = Net specific energy G (MJ/kg) = Gross specific energy \rho (kg/m³) = Density at 15°C w (mass %) = Water content a (mass %) = Ash content s (mass %) = Sulfur content
```

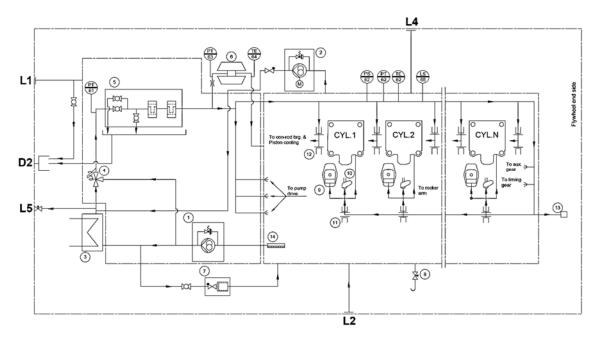

Ref. ISO 8217:2017(E)

^{*} Refer to that the actual specific energy test method (for example ASTM D 240) takes priority over the specific energy calculation method as above.

7.1.1 General description

The engine has its own internal lubricating oil system with the wet type oil sump, which supplies lubricating oil to all moving parts for lubricating as well as cooling.

Most of oil passages are incorporated into engine components and equipment in the system, which are mounted directly on feed module without pipe connections.

The internal lubricating oil system comprises following equipment:

- ✓ Lubricating oil cooler
- ✓ Engine driven lubricating oil pump (with pressure regulating valve)
- Electric motor driven pre-lubricating pump
- ✓ Lubricating oil thermostatic valve
- ✓ Lubricating oil filter
- ✓ Wet sump tank
- ✓ Centrifugal oil filter
- ✓ Oil mist detector (option)

Quantity of lubricating oil (wet sump)

Table 7.3 Total quantity of lubricating oil inside the engine

| 9H25/33 | 1330 | 1670 | 1620 | 1970 | |

Lubricating oil consumption

Specific lubricating oil consumption: 0.6 g/kWh

- ✓ Tolerance: +25 % depending on the operating condition
- ✓ Only maximum continuous rating should be used to evaluate the lubricating oil consumption.

Engine driven lubricating oil pump

The engine driven lubricating oil pump is a gear type, mounted on the feed module of the engine. The pump is designed to provide sufficient flow even at low speed.

Pre-lubricating oil pump

The pre-lubricating pump is gear type, and electric motor driven. The pre-lubricating pump is automatically started to operate when engine is stopped. And the pre-lubricating is required during the engine stop period if the fuel oil is circulating. In case that the automatic pre-lubrication has been switched off, the engine must be pre-lubricated sufficiently before starting up.

Lubricating oil cooler

The lubricating oil cooler is plate type, mounted on the feed module of the engine.

Thermostatic valve

The thermostatic valve is the wax element type, working at fixed temperature range of $60 \sim 69$ °C, is mounted on the feed module of the engine.

Lubricating oil filter

The lubricating oil filter is duplex paper cartridge type, mounted on the feed module of the engine. Each filter has a safety cartridge of stainless steel.

✓ Paper cartridge fineness : 15 μm

✓ Safety cartridge fineness : 60 µm

Pressure regulating valve

The pressure regulating valve adjusts inlet pressure after lubricating oil filter at $4 \sim 5$ bar and is mounted on feed module of the engine.

Centrifugal oil filter

Centrifugal oil filter can be mounted on engine. The centrifugal force is taken from the oil pressure.

Lubricating oil sump drain

It is recommended to use the separator suction pipe for draining of the lubricating oil sump.

7.2 External lubricating oil system

Diagram for external lubricating oil system

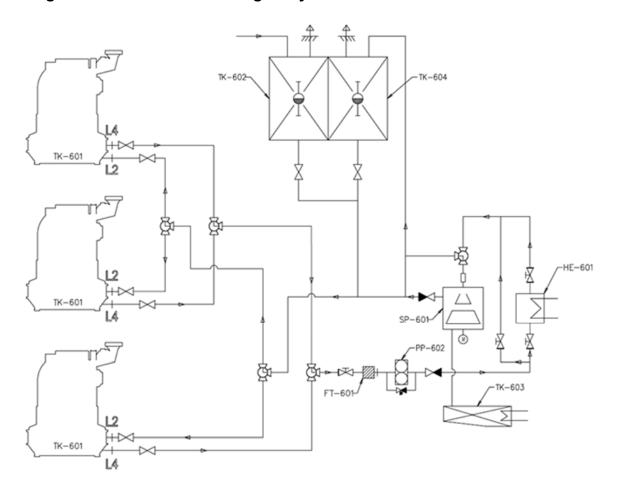

Figure 7.2 Diagram for external lubricating oil system for multi-engine installation [B91-314112-7.1]

Table 7.4 System components

| Code | Description | Code | Description |
|--------|--------------------|--------|------------------------------|
| TK-601 | System oil tank | HE-601 | Pre-heater for the separator |
| TK-602 | Storage tank | SP-601 | Separator |
| TK-603 | Sludge tank | PP-602 | Feed pump for the separator |
| TK-604 | Separated oil tank | FT-601 | Suction strainer |

105/172 2nd Edit. Dec. 2024

7.2.1 General description

The external lubricating oil system is required for not only cleaning but also heating the oil to start the engine quickly. The system shall be used commonly for all auxiliary engines.

Though filtering equipment built on engine shall be sufficient for the engine operating only marine diesel oil, the centrifugal purification is commonly required for marine diesel oil and heavy fuel oil operation.

7.2.2 Lubricating oil separator

Self-cleaning type or manual cleaning type separator can be used.

Separator capacity

The separators should be dimensioned for continuous operation and following formula can be used, as a guidance, for estimating the required flow for the separator capacity:

```
F = p \times 1.4 \times n/t
```

```
Where:
```

```
F (I / h) = required flow p (kW) = total engine output n = number of oil circulation per day (4 for marine diesel oil / marine gas oil, 6 for heavy fuel oil) t = actual separation time per day (Normally, 23 hour)
```

For the simple estimation, above formula can be expressed as follows:

```
F = 0.3 \times p (I/h)
```

The below formula is used to find the rated capacity for the separator:

```
V = F / B (I/h)
```

Where:

```
V (I/h)= rated capacity for the separator F (I/h)= required flow B = throughput factor (0.2 ~ 0.25)
```

Throughput factor (B) shall be in accordance with the separator maker's recommendations.

Separator installation

The separator should be in continuous operation while the engine is on running in order to ensure removal of contaminants as quick as possible. If possible, the separator should be in operation also when the engine on shut-down for the reducing of the contamination level. In the latter case, oil temperature for efficiencies of separation needs to be maintained through heaters. Those installations with their separation plant shut down during engine stop, should consider re-starting the separator prior to engine start-up because contamination (engine leaks, condensation) could occur during engine stop.

With multi-engine plants, it would be the best to install one separator per each engine (Figure 7.3). The cleaning systems of auxiliary engines are often designed such that the separator intermittently serves on engine at a time. If only one separator is in operation, the following layouts can be used (Figure 7.4).

Oil cleaning, the discharge depending upon the operating time between two periods of oil cleaning the discharge interval may have to be shortened during the first couple of hours. In this way the separator will be able to cope with the high level of contaminants at the beginning of the cleaning phase. The appropriate discharge interval has to be found by trial and error.

It is important that maintenance and operation of the separator should be performed according to the manufacturer's recommendations.

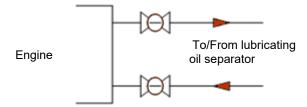

Figure 7.3 Principle layout for direct separating on single engine.

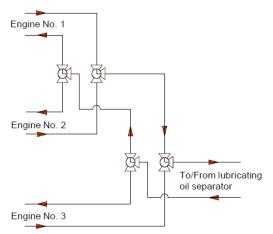

Figure 7.4 Principle layout for direct separating on multi engines

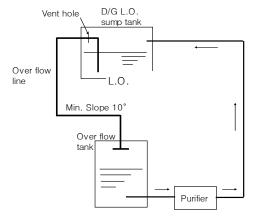

Figure 7.5 Principle layout for overflow system

It should be ensured that the separator is only connected with one engine at a time. In order to ensure that there is no suction and discharging from one engine to another.

To provide the mentioned above, it is recommended that inlet and outlet valves can be changed over simultaneously.

With only one engine in operation there are no problems with separating, but if multi engines are in operation for some time it is recommended to split up the time so that there is separation on all engines, which are operating in turns.

Overflow system

In some cases, overflow system can be applied as an alternative for continuous purification (Figure 7.5). In order to have a better syphon effect, the overflow pipe from sump to overflow tank should have a continuous downward gradient of minimum 10 degrees without high and low point.

Suction strainer

0.8 ~ 1.0 mm mesh size of suction strainer should be inserted before the separator pump.

Pump for separator

The pump can be either directly driven by the separator or driven by an independent motor as recommended from a separator maker.

Heater for separator

The lubricating oil in wet sump tank and in the system is to be warm-up to 40 $^{\circ}$ C from the separator heater prior to engine starting. The lubricating oil in sump tank is to be heated-up to approx. 65 $^{\circ}$ C in engine service. Heater for separator is to be designed to heat the lubricating oil from 65 $^{\circ}$ C up to 95 $^{\circ}$ 98 $^{\circ}$ C according to separator maker's recommendation.

If the separation temperature is lowered from 95 $^{\circ}$ C to 90 $^{\circ}$ C, the separator throughput has to be reduced by 22 $^{\circ}$ C to maintain the same separation efficiency.

7.2.3 Velocities and pressure losses

In order to prevent excessive pressure losses in the piping system, we recommend that the lubricating oil velocity should not exceed :

✓ Suction pipe : $0.5 \sim 1.5$ m/s ✓ Pressure pipe : $1.0 \sim 2.5$ m/s

7.2.4 Crank case ventilation

Where two or more engines are installed, vent pipes, if fitted, and lubrication oil drain pipes should be independent to avoid inter circulation between crankcases.

- The crankcase vent pipes from each engine shall be led independently to the top of the funnel. The pipes should not be connected to any other branch such as a tank vent, etc.
- ✓ The outlet of vent pipe is to be fitted with corrosion resistant flame screen separately for each engine.
- ✓ The vent pipe should have a continuous upward gradient of minimum 10 degrees without high point or low point.
- ✓ The vent pipe should be equipped with a condensate trap and drain near the engine.
- ✓ The connection between the engine and yard vent pipe is to be flexible, if resilient mounting is applied.
- ✓ The dimension of the flexible connection is 80A, and the vent pipe size after the flexible connection must be min. 80A.
- ✓ The oil mist should not be go into suction side of intake duct located outside (for outdoor type) or engine room (for indoor type).
- ✓ Criteria for high back pressure of crank case ventilation is that the maximum crank case inner pressure should not exceed 30 mmWC at maximum continuous rating.

7.3 Lubricating oil specification

7.3.1 Oil grade

The medium-alkaline, heavy duty (HD) oils in API-CD class have to be used for HiMSEN engine including turbocharger lubrication. Please refer to the Table 7.5.

7.3.2 Oil viscosity

The oil viscosity is based on SAE 40 oil and recommended to be 145 mm²/sec. at 40 °C.

The lubricating oil should be heated to 40 °C prior to engine start.

7.3.3 Governor oil grade

In case of the hydraulic governor, an independent oil system is required. For further information, please refer to the Table 7.6.

BN value

BN (Base Number) is a measure of the alkalinity or basicity of the oil. It is expressed in milligrams of potassium hydroxide per gram of the oil (mg KOH/g).

Alkalinity in lubricating oil is necessary to neutralize the acidic combustion products coming from the sulfur in fuel. Therefore, lubricating oil with suitable BN should be selected to maintain proper balance between alkalinity in lubricating oil and the sulfur level in fuel after consulting with lubricating oil supplier or specialist.

- √ High sulfur fuel + low BN lubricating oil → Excessive corrosive wear
- ✓ Low sulfur fuel + high BN lubricating oil → Excessive top land deposit formation
 - → Lacquering formation on cylinder liner surface

7.3.4 Lubricating oil selection

The general lubricating oil BN selection strategy is to match the lubricating oil with the fuel sulfur contents (%). Because BN decreases at various rates in each engine and condition, lubricating oil consumption also should be considered to have sufficient equilibrium during operation.

When the marine diesel oil and marine gas oil are to be used only for temporary engine operation, higher BN lubricating oil used for residual fuel (heavy fuel oil) would not present any problems. The acceptable period of temporary operation is less than 200 hours.

It is necessary to use proper lubricating oil based on sulfur content of fuel as per the lubricating oil list for HiMSEN engine described on the instruction manual in order to avoid excessive deposits in the combustion chamber, exhaust gas line and turbochargers.

Residual fuel

Table 7.5 Residual fuel

| Sulfur contents (%) | BN |
|---------------------|---------|
| 3.5 - | 40 - 55 |
| 0.5 - 3.5 | 30 - 40 |
| 0.1 - 0.5 | 20 - 30 |
| - 0.1 | 20 |

Distillated fuel

✓ Distillated fuel (marine gas oil / marine diesel oil) : BN10 ~ 20

^{*} Refer to the Sheet '6.3 Fuel oil specification' for specification of residual and distillated fuel.

8.1.1 General description

The engine has two cooling water circuits internally, which are low temperature and high temperature water circuits. Most of the components of circuits are modularized and directly mounted on the feed module. Please refer to Figure 2.4.

Low temperature water circuit comprises :

- ✓ Engine driven pump (option)
- ✓ Charge air cooler
- ✓ Lubricating oil cooler
- ✓ Wax type thermostat valve (option), dividing type (temp. range : 35 ~ 45 °C fixed)

High temperature water circuit comprises:

- ✓ Engine driven pump
- ✓ Engine water jackets and cylinder heads
- √ Wax type thermostat valve, dividing type (temp. range : 79 ~ 88 °C fixed)

Scope of supply

The internal cooling system consists of the following built-in equipment. Marked (*) equipment can be supplied as option on request.

- ✓ * Engine driven low temperature cooling water pump (option)
- ✓ Engine driven high temperature cooling water pump
- ✓ One stage charge air cooler
- ✓ High temperature cooling water control thermostatic valve
- * Low temperature cooling water control thermostatic valve (option)
- ★ Electric pre-heater unit or electric preheat element on engine (option)

119/172 2nd Edit. Dec. 2024

8.2.1 General description

The engine has two cooling circuits of low temperature cooling water and high temperature cooling water internally. However, the external connections can be provided for one (system-1) or two string (system-2) cooling circuits.

Pressure drop

✓ Engine high termperature cooling water system
 ✓ Charge air cooler
 ✓ Lubricating oil cooler
 ✓ Thermostatic valve
 : approx. 0.5 bar
 : approx. 0.2 bar
 : approx. 0.5 bar

(These values shall be different depending on the actual design of each vessel or plant.)

Fresh water velocity

√ Max. 2.5 m/s

Sea water velocity

✓ Suction pipe : 1.0 ~ 1.5 m/s✓ Delivery pipe : 1.5 ~ 2.5 m/s

Expansion tank

To avoid cavitation in cooling water system, a certain suction head for engine driven cooling water pump is required as follows :

✓ Minimum head : 0.5 bar (5 meters above the crank shaft level)

✓ Tank volume : 120 liter + α^{1})

1. α: Min. 10% of high temperature cooling water and low temperature cooling water volume of each engine(s).

Table 8.7 Cooling water volume of the engines

| Engine type | High temperature cooling water and low temperature cooling water volume |
|-------------|---|
| 6H25/33 | 460 liter |
| 7H25/33 | 480 liter |
| 8H25/33 | 500 liter |
| 9H25/33 | 520 liter |

Central cooling

The central cooler for fresh water can be of the tube or plate type, which can be common for several engines or separate for each engine.

1) Fresh water side

- ✓ Flow quantity and heat dissipation : Refer to '3.2 engine capacity data normal rating and 3.5 engine capacity data higher rating'.
- ✓ Pressure drop : maximum 0.5 bar.
- ✓ Pump : centrifugal type (Electric motor driven)
- ✓ Water temperature before engine : 36 °C

2) Sea water side

✓ Flow quantity : 1.5 times of fresh water flow

✓ Pressure drop : 1.0 ~ 1.5 bar

8.2.2 Cooling water pressure of engine inlet

Pressure of engine inlet should be kept under 2.5 bar.

8.2.3 Cooling water

The cooling water system is designed for using normal fresh water with dosing corrosion inhibitor.

If sea water or other coolant system should be applied, please contact the engine maker separately in advance.

Pre-heating

In order to ensure start of engine and quick load up, pre-heating facility must be installed on the internal or external cooling water circuit. Pre-heating for all engines are required. Pre-heating temperature:

✓ Marine diesel oil operation : minimum 40 °C

✓ Heavy fuel oil operation : minimum 60 °C

Electric pre-heating element (Option)

The mount type on the cooling water preheating arrangement consists of a thermostat-controlled electric-heating element which is built in high temperature cooling water circuit located on the engine's Feed Module. The pre-heater is activated by thermostat at 60 $^{\circ}$ C which provides water (60 $^{\circ}$ C) to jacket water outlet.

Table 8.8 Recommended capacity of pre-heater

| Cyl. | Electric pre-heater (kW) |
|------|-----------------------------|
| 6 | 20 |
| 7 | 20 |
| 8 | 20 |
| 9 | 20 |

^{1.} The baggiest capacity is applied for all cylinder for better heating effect

Operation

Before the engine starts on heavy fuel oil / marine diesel oil, the engine jacket must be preheated by pre-heater.

It is recommended that the pre-heater is arranged for automatic operation, so that the pre-heater shall be disconnected while the engine is running and connected while the engine is stand-by condition.

When the engine is in standstill, an external valve for pre-heater must be shut off the cooling water inlet.

Preheating unit (Option)

External pre-heating unit comprising with the follows can be supplied as option :

- ✓ Electric
- ✓ Circulating water pump
- ✓ Control panel and circulating pump starter
- ✓ Switch on-off of heating media

The capacity of external pre-heater should be $2.2 \sim 2.5$ kW per cylinder. The flow through the engine for each cylinder should be approx. 2.5 liter / min. with flow top and downwards.

Auto shut off valve must be installed on the external cooling water system to ensure preheating, which prevents cooling water from flowing into the engine during preheating.

Preheating of stand-by engine

When only one engine sets are in service and others in stand-by, cold cooling water should not be passed into the cooling jackets on stand-by engines, which will cause cold corrosion in cooling system.

Stand-by engines should be kept warm condition through heating source such as thermal heating through venting pipe from a running engine or pre-heater.

8.3 Cooling water quality and treatment

8.3.1 Quality of cooling water

The cooling of the engine should be done by only distilled (demineralized) or fresh water, which should be checked and treated to satisfy following requirements below table before adding corrosion inhibitor.

It is necessary for keeping effective cooling and preventing corrosion of the system.

Though the distilled water fully satisfy to the requirements for cooling water, it is necessary to add corrosion inhibitor before applying cooling water to engine cooling water system because untreated cooling water absorbs carbon dioxide from the air and then becomes corrosive.

Table 8.9 Quality of cooling water

| рН | 7 to 9 |
|-------------------------------------|------------------------|
| Total Hardness as CaCO ₃ | Maximum 75 ppm (mg/l) |
| Chlorides Cl- | Maximum. 80 ppm (mg/l) |
| Sulphates as SO4 ²⁻ | Maximum 100 ppm (mg/l) |
| Silica as SiO₂ | Maximum 60 ppm (mg/l) |
| Residue after evaporation | Maximum 400 ppm (mg/l) |

^{1.} Chloride and Sulphate are corrosive even in the presence of an inhibitor.

Sea water or fresh water contaminated by sea water even in small amount is not allowed to be used as cooling water of the engine due to high risk of severe corrosion and deposits formation in the system.

Rainwater is heavily contaminated and highly corrosive in general, which is also not recommended as cooling water.

Tap water (drinking water) is not recommended as cooling water due to risk of chalk deposit formation inside the cooling system.

However, if the distilled water, for example from fresh water generator, is not available, tap water may be used as cooling water after softening and some other treatments according to the ingredients.

8.3.2 Treatment of cooling water

Cooling water should be treated properly and corrosion inhibitor should be added.

The analysis and treatment of cooling water are recommended to be carried out by experts. Otherwise, comply the treatment procedures strictly according to the instructions from the supplier.

The recommended products are listed in following table.

Table 8.10 Recommended products list

| Manufacturer | Brand name | Constituent | Delivery form | Recommended Dosage | |
|--------------------------------|---------------------------------|---------------------|---------------|-------------------------|--|
| Chevron (FAMM) | DELO XLI(Havoline XLI) | Carboxylates | Liquid | 75 liter / 1000 liter | |
| VECOM | Cooltreat NCLT | Nitrite | Liquid | 48 liter / 1000 liter | |
| Wilhelmsen Chemicals | Rocor NB | Nitrite, Borate | Liquid | 63 liter / 1000 liter | |
| | NALCOOL2000, TRAC102 | | Liquid | 128 liter / 1000 liter | |
| NALCO | TRAC100 | Molybdate, silicate | Liquid | 17.5 liter / 1000 liter | |
| | TRAC115,TRAC108 | Nitrite, Borate | Liquid | 28 liter / 1000 liter | |
| GE | CorrShield NT4200 | Nitrite | Liquid | 30 liter / 1000 liter | |
| Water and Process Technologies | Consilied W14200 | Nune | Liquiu | 30 liter / 1000 liter | |
| Shell | Shipcare Cooling Water Treat | Nitrite, Borate | Liquid | 128 liter / 1000 liter | |
| Drew marine | LIQUIDEWT | Nitrite | Liquid | 24 liter / 1000 liter | |
| Diew Illallile | MAXIGARD | Nitrite | Liquid | 64 liter / 1000 liter | |
| Houghton | Tectyl CW-70N-TEA | Nitrite | Liquid | 66 liter / 1000 liter | |

^{1.} Follow the guidelines of corrosion inhibitor manufacturer for cooling water treatment.

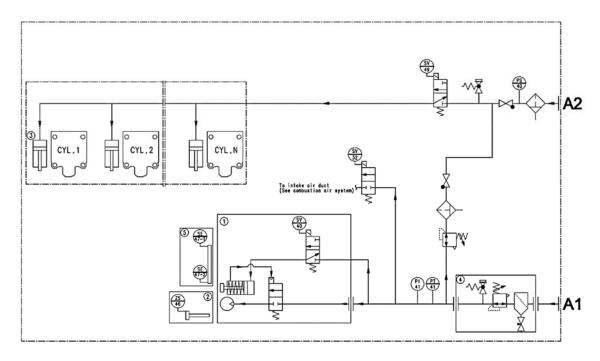

Oily inhibitors adhere to cooling surface and influence cooling efficiency, which are not recommended for cooling water. Only nitrite-borate based inhibitors are recommended.

^{3.} Some inhibitors may be toxic and hazardous. Strict control is required when handling inhibitors.

9 Air and exhaust gas system

9.1 Internal compressed air system

Diagram for internal compressed air system

^{*)} Supply scope and instrument will be determined by EOD(Extent of Delivery) and engine builder's standard.

Table 9.2 System components

| No | Description | Remark |
|----|---------------------|--------|
| 1 | Air starter | |
| 2 | Manual turning gear | |
| 3 | Fuel pump rack | |
| 4 | SRS valve | |
| 5 | Crankshaft | |

9.1.1 General description

Compressed air of max. 30 bar is supplied for engine start, emergency stop and safety system as for the control air. The detail information of engine operation is explained in the chapter '5. Operation and control system'.

Starting system

Starting system mainly consists of relay valve, air starting valve and starting air motor unit for starting the engine by turning flywheel with gears. The compressed air is directly delivered to the air start motor through reduction valve

Engine stopper

Engine stopper consists of stop solenoid valve and stop cylinder incorporated in fuel injection pump and governor stop. It is for immediate engine stop.

Fuel limiter unit

Fuel limiter unit is provided for governor of Woodward UG type, which limits the amount of fuel during engine starting.

Scope of supply

The compressed air system consists of the following equipment:

- ✓ Engine starter complete
- ✓ Stop solenoid valve and stop cylinders
- ✓ Fuel limiter unit for governor

9.2 External compressed air system

Diagram for external compressed air system

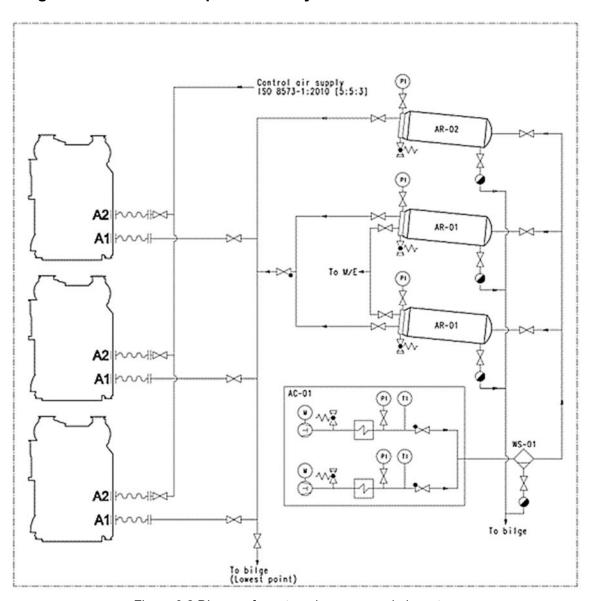

Figure 9.2 Diagram for external compressed air system

Table 9.3 System components

| Code | Description | Code | Description |
|-------|-------------------|-------|-------------------------|
| AR-01 | Main air receiver | WS-01 | Oil and water separator |
| AR-02 | Aux. air receiver | AC-01 | Main air compressor |

127/172

9.2.1 General requirements

The maximum 30 bar for the compressed air system is required for engine operation. Therefore, all external supply system should be properly designed for this nominal pressure and also should satisfy the rules of corresponding classification society.

Dry and clean air is essential for the reliable function of the engine starting and control system.

Therefore, the compressed air supply system should include oil and water separating equipment. The air supply pipe to engine should also be arranged with slope and the water trap should be positioned at the lowest points.

9.2.2 Starting air volume of the engine

Air consumption per one start is specified in '3.2 engine capacity data - normal rating and 3.5 engine capacity data - higher rating'. The capacity of starting air vessel varies as per Classification Societies or Customer's requirement.

Volumes for three starts(include jet assist air volume) of one auxiliary engine are as follows;

Table 9.4 Starting air volume of the engines

| Engine type | Volume (liter) |
|-------------|----------------|
| 6H25/33 | 680 |
| 7H25/33 | 700 |
| 8H25/33 | 720 |
| 9H25/33 | 740 |

9.2.3 Compressed air specification

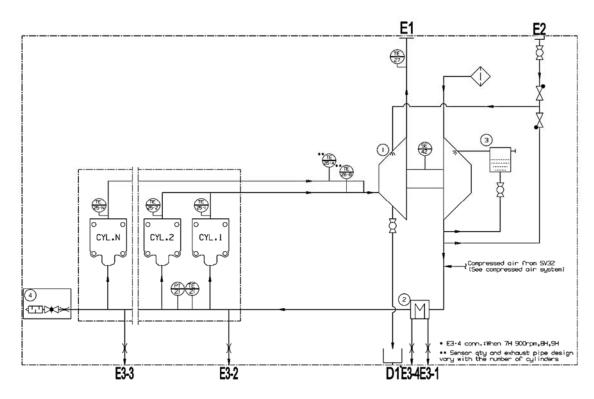

To ensure reliable engine operation and prevent damage to the components in the compressed air system, the compressed air must be free from contaminants such as particles, water, and oil. The required compressed air specification is as follows;

Table 9.5 compressed air specification

| Starting air (A1 conn.) | |
|---|------------------------------------|
| Design pressure | 30 bar |
| Working pressure | 15~30 bar |
| Compressed air quality at engine connection | ISO 8573-1:2010 [7:8:X] |
| Control air (A2 conn.) | |
| Design pressure | 10 bar |
| Nominal pressure | 7 bar (Working pressure 6.5~8 bar) |
| Compressed air quality at engine connection | ISO 8573-1:2010 [5:5:3] |
| Consumption | Max. 2.5Nm³/h |

9.3 Internal combustion air system

Diagram for internal combustion air system

1. Connection size is according to JIS B 2220.

Table 9.7 System components

| No | Description | Remark |
|----|--|--------|
| 1 | Turbocharger | |
| 2 | Charge air cooler | |
| 3 | Compressor washing device (Water vessel) | |
| 4 | AWG (Air waste gate valve) | |

9.3.1 General description

The air required for combustion is taken from the engine room through a filter fitted on the turbocharger. It is imperative that the combustion air be free from sea water, dust and fumes etc.

Turbocharger

Turbocharger is a radial uncooled type with high efficiency and mounted on the feed module of the engine. The water washing systems for the compressor and turbine are supplied as standard.

Charge air cooler

Charge air cooler is one stage fresh water cooled type. In general, sea water cooled type charge air cooler is not recommended.

Charge air waste gate valve

Charge air waste gate valve can be installed as optional for increasing exhaust gas temperature (for active SCR) or operating of arctic condition.

Water mist catcher

Water mist catcher is installed between charge air cooler and air chamber of engine block.

Air chamber

Air chamber is incorporated into the engine block with large volume for even distribution of induced air to each cylinder.

Exhaust pipe system

Exhaust pipe system is a pulse type, which has better performance at low load with good acceleration. In this case, a jet air system may be required to improve acceleration.

Water drain pipes

Water drain pipes are installed for the air chamber and water mist catcher.

9.4 External combustion air system

9.4.1 General description

As the engines are consume considerable amount of air in the engine room directly, or the outdoor intake air system is required, the design of combustion air is important not only for man-working but also for engine running.

Various requirements are applicable depending on the ambient condition but the minimum requirements and recommendations for the engines are described as follows.

9.4.2 Combustion air

Arrangement of intake air pipes should be made to supply fresh air for engine combustion, which should be free from any risk of water spray, exhaust gas, dust, oil mist and electric equipment, etc.

In case of the engine room intake air system, the intake air temperature of the engine room would be increased by the radiation heat from the engines and generators. Therefore intake air ducts should be installed to face the air intake silencer for each turbocharger as close as possible.

In case of the outdoor direct intake air system, the independent intake air system should be applied for each turbocharger even for the case of engine with two or more turbochargers. A different intake air design for the engine of each project, please contact to HHI-EMD. The piping system of intake air should be considered to allow thermal expansion and harmful vibration to avoid stress of pipe. The end of deep slope position of intake air pipe, cleanable waste trap and water drain should be prepared.

Combustion air intake pipe system, the air velocity must not exceed 15 m/s during engine running. Prior to commissioning, the pressure loss must be checked at compressor side whether the depression of compressor air inlet must not exceed 200 mmWC as maximum. The measuring point is approx. $1 \sim 2$ m before from the turbocharger air inlet casing.

Air consumption volume should be designed in accordance with '3.2 engine capacity data – normal rating and 3.5 engine capacity data – higher rating'.

Air filteration should be prevented from the outdoor's sand, cement, dust, and other particles. All particles size are not to be entered maximum 5 µm and above.

Oil bath type filter are generally used for the industrial area, cement plants, and sand winded area. Recommendable pressure loss of oil bath intake filter is $50 \sim 70$ mmWC and even of fouled condition, it must be kept within 110 mmWC.

Environmental condition of maximum particle size of dust is typically applied depending on site.

- ✓ Non-industerial area in rain / dry condition : 0.8 / 2 µm
- ✓ Area of emissions, chimneys, work area : 60 µm
- ✓ Metropolitan area, residential / Industrial area: 7 / 20 µm
- ✓ Desert area, during sand storms : 500 μm

Ventilation of engine room

To determine the amount of air ventilation for an engine room, all heat sources of the engine room should be considered.

Total amount of ventilation of auxiliary engine = Qc + Qr + Qv (m³/h)

Where:

```
Qc ( m^3/h ) : Air required for engine combustion,

Qr = \frac{\text{Engine radiation heat (kJ/h)}}{\text{Air conditioning factor (Qa = 12)}}
```

Qv (m³/h): Air required for other heat sources such as alternator and exhaust gas pipe, etc.

1. Should outdoor intake air system, and shut-off of air intake be necessary, a special provision is required as option.

9.5 External exhaust gas system

9.5.1 General description

Exhaust gas of the engine flows out from turbocharger to atmosphere via an external exhaust gas system, which may be comprised of expansion bellows, exhaust gas pipe, exhaust gas boiler (possibly) and silencer, exhaust gas ventilation unit, relief valve (or rupture disc), etc.

Independent exhuast gas system

Independent exhaust gas system should be prepared for each engine even for the case of common boiler system with other engines. In case of applied two or more turbochargers on a single engine, the exhaust gas pipes are recommeded to be combined into a Y-type forked pipe. And each exhaust gas pipe have to be symmetric and each exhaust gas flow should be no interference.

Exhaust gas back pressure

Back pressure of the exhaust system in total is recommended to be less than 300 mmWC at miximum countious rating. The maximum back pressure should not exceed 500 mm WC at miximum countious rating. Please see the '3.9 correction of fuel oil consumption' for the fuel consumption correction in case of exceeding 300 mmWC at miximum countious rating. The measuring position is approx. $1 \sim 2$ m after the turbocharger gas outlet casing.

9.5.2 Velocity

External exhaust gas piping is recommended to be designed that velocity of exhaust gas through pipes should not exceed approximately 40 m/sec at maximum continuous rating.

Insulation

Insulation of the whole exhaust system is required for the safety and to reduce noise and loss of thermal energy, which, of course, should comply with requirements of classification society and other related authorities.

9.5.3 Piping design for exhaust gas system

In order to have lower back pressure and thermal loss, following design consideration is required;

- ✓ Pipe should be as short and straight as possible. Pipe bendings should be minimized and the bending radius should be as large as possible.
- ✓ A water separating pocket and drain should be provided on the pipe.
- ✓ Rigid (fixed) supports and movable supports must be provided considering the thermal expansion and vibration of pipes.
- √ The exhaust gas outlet of Turbocharger can be turned on request.

For more information, please refer to the sheet '9.6 external exhaust gas pipe connection'.

9.5.4 Expansion bellows

The expansion bellows has to be mounted between the turbocharger outlet and external exhaust gas pipe in order to compensate thermal expansion and mechanical vibration. The expansion bellows are supplied separately as standard. However, an additional expansion bellows may be required depending on the actual length of exhaust pipe in total.

- 1. The external exhaust pipe must not exert any force against the gas outlet on the engine.
- 2. The external exhaust pipe just on expansion bellows should be fixed rigidly so that turbocharger can be free from any forces from the external exhaust pipe.
- 3. The sturdy fixed-point support must be provided for the expansion bellows on the turbocharger. It should be positioned, immediately above the expansion bellows in order to prevent the transmission of forces, resulting from the weight, thermal expansion or lateral displacement of the exhaust piping, to the turbocharger.
- 4. The exhaust piping should be mounted with a slope towards the gas outlet on the engine. It is recommended to have drain facilities in order to be able to remove condensate or rainwater.

Installation procedure for expansion bellow

- ✓ The generating set (or engine) should be installed in its final position before any external pipes are connected.
- ✓ Remove the counter flange from the engine connection, if fitted.
- ✓ Fasten the counter flange temporarily to the outlet side of the bellows. For the correct orientation of the bellows (flow direction), see the dimensional drawing.
- ✓ Fasten the bellows to the engine temporarily.
- ✓ Align the external pipe to the counter flange. No axial, lateral or angular deflection of the bellows is allowed. Anchor the external pipe to the steel structure within 1 m from flange. Observe that the pipe clamping with bracket must be very rigid in order to prevent vibration and movement of the exhaust gas pipe. Most problems with bursting and vibration originate from poor clamping and support. Especially the support in the axial direction must be rigid.
- ✓ Put some temporary protection cover between the flanges in order to prevent debris from falling into the turbocharger.
- ✓ Tack weld the counter flange to the external pipe.
- ✓ Remove the bellows and weld the flange finally to the external pipe.
- ✓ Remove the protection cover. Place the bellows with gaskets between the flanges.
- ✓ Lubricate the threads of the connection screw with heat resistant grease and tighten first until finger tight. Finally tighten the screw in a diagonal sequence.
- ✓ Remove the guide bar between the flanges of the bellows.

9.5.5 Exhaust gas boiler

Thermal energy of exhaust gas can be utilized by boiler. Please refer to the sheets ' 3.2 engine capacity data – normal rating and 3.5 engine capacity data – higher rating' for the exhaust gas data. A boiler may be a separate unit for each engine or a common unit with other engines. In any cases, however, the exhaust gas line for each engine should be separated from other engine's exhaust gas lines.

The back-pressure through boiler should be minimized to be within limited level for total exhaust gas system.

9.5.6 Exhaust gas silencer

Exhaust gas silencer can be supplied as option on request. The noise attenuation of silencer shall be either 25 dB(A) or 35 dB(A). For more information, please refer to the sheets for '9.8 exhaust gas silencer with spark arrestor' and '9.9 exhaust gas silencer without spark arrestor'.

9.6 External exhaust gas pipe connection

9.7 Approach of SCR (Selective Catalytic Reduction) system installation

9.7.1 General description

IMO NOx Tier III regulation was in effect from the year 2016 according to IMO's environmental policy, in which NOx emission should be reduced by 80 % level comparing to the IMO NOx Tier I. SCR (Selective Catalytic Reduction) system became one of proper solutions to meet the IMO NOx Tier III regulation.

The HiMSEN engine is able to be combined SCR (Selective Catalytic Reduction) systems provided by third parties. However, HHI-EMD recommends using Hyundai NoNOx SCR (Selective Catalytic Reduction) system for convenience such as testing NOx Scheme A test for EIAPP certificate and providing integrated technology. For detailed specifications of Hyundai NoNOx, please see the HYUNDAI HiMSEN ENGINE programme or contact to HHI-EMD.

9.7.2 Boundary conditions for SCR (Selective Catalytic Reduction) operation

General boundary conditions for SCR (Selective Catalytic Reduction) operation :

Main diesel fuel oil

✓ The diesel fuel for SCR (Selective Catalytic Reduction) operation should be selected according to the sulfur content in consideration of the sailing region and SCR (Selective Catalytic Reduction) specifications.

Exhaust gas temperature

✓ The minimum required temperature for SCR (Selective Catalytic Reduction) operation
is determined by the sulfur content in fuel and SCR (Selective Catalytic Reduction)
specifications.

Maximum exhaust gas back pressure

✓ Allowable back pressure in total of the exhaust system to guarantee fuel consumption see the sheet '9.5.1 General description'. It is not recommended that the exhaust gas's total back pressure exceeds 500 mm WC in diesel mode MCR (Maximum Countious Rating).

Other equipment installation such as exhaust gas boiler, silencer, etc. between the engine and the SCR chamber is not recommended in order to keep exhaust gas temperature.

9.7.3 Exceptionals

In exceptional cases of SCR (Selective Catalytic Reduction) installation, please contact to HHI-EMD.

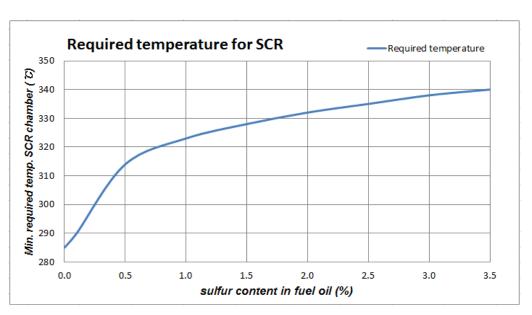

Figure 9.5 Minimum required exhaust gas temperature for SCR operation

1. When SCR (Selective Catalytic Reduction) units are installed, the heat loss of the exhaust gas pipe between engine and SCR (Selective Catalytic Reduction) chamber should be designed to be minimized in order to keep the required exhaust gas temperature. The supports of exhaust gas pipe should be designed and installed to minimize heat loss.

9.8 Exhaust gas silencer with spark arrestor

The silencer is of an absorption type delivered with spark arrestor and mounting bracket, excluding insulation. The silencer can be mounted horizontally or vertically.

The gas flow passes through a straight perforated tube, surrounded with an efficient sound absorbing material. The silencer gives whereby an excellent sound attenuation suitable for even a wide operating range.

The gas pressure will be dropped into an approximate value shown on the graph, pressure loss vs. gas velocity.

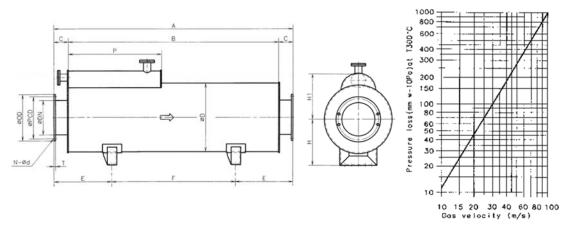

Figure 9.6 Exhaust gas silencer (25 dB type)

9.9 Exhaust gas silencer without spark arrestor

The silencer is of an absorption type delivered with mounting bracket, excluding the spark arrestor and insulation. The silencer can be mounted horizontally or vertically.

The gas flow passes through a straight perforated tube, surrounded with an efficient sound absorbing material. The silencer gives whereby an excellent sound attenuation suitable for even a wide operating range.

The gas pressure will be dropped into an approximate value shown on the graph, pressure loss vs. gas velocity.

9.10 Generator information

Mounting of generator

As a standard design of H25/33 engine, the engine and generator are coupled with disc coupling and rigidly mounted on common base frame.

Generator bearing

Type of generator bearing is of single sleeve, self-lubricating type and mounted end of generator.

Optional design

As special arrangement, double sleeve bearing, forced lubricating of generator bearing, cooler and flexible coupling can be applied as an optional design on request.

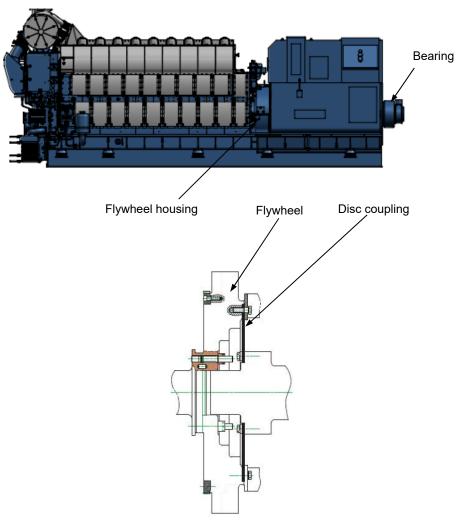

Figure 9.10 Disc coupling outline

12 Appendix 2 (Instrumentation code)

*Refer to standard location and text for instruments on the following page

| Specification of letter code for measuring devices | | | |
|--|-----------------|-------------------|-----------------|
| 1st letter | | Following letters | |
| F | Flow | А | Alarm |
| L | Level | D | Differential |
| Р | Pressure | E | Element |
| S | Speed, Solenoid | н | High |
| Т | Temperature | I | Indicating |
| U | Voltage | L | Low |
| V | Viscosity | S | Switching, Stop |
| Z | Position | Т | Transmitting |
| | | X | Failure |
| | | V | Valve |

Combustion gas system

- 21 Charge air at cooler outlet
- 25 Exhaust gas at cylinder outlet
- 26 Exhaust gas at turbocharger inlet
- 27 Exhaust gas at turbocharger outlet
- 49-1 Alternator winding 1
- 49-2 Alternator winding 2
- 49-3 Alternator winding 3

Compressed air system

- 40 Air starting valve / emergency stop valve
- 41 Compressed air at engine inlet
- 42 Turbocharger speed
- 43 Charge air condition valve
- 45 Stop solenoid on governor
- 46 Micro switch for turning gear
- 47 Engine speed
- 48 Over speed
- 49 On-off valve for shut down and overs peed stop
- 50 Fuel rack limiter solenoid valve

Fuel oil system

- 51 Fuel oil at engine inlet
- 52 Fuel oil filter inlet
- 54 Leakage alarm tank

Lubricating oil system

- 61 Lubricating oil at filter inlet
- 62 Lubricating oil at engine inlet
- 63 Lubricating oil at turbocharger inlet
- 65 Pre-lubricating
- 68 Level in base frame
- 92 Oil mist detector

Cooling water system

- 71 Low temperature water at air cooler inlet
- 72 Low temperature water at air cooler outlet
- 75 High temperature water at engine inlet
- High temperature water at engine outlet
- 77 High temperature water each cylinder outlet
