1 General information

1.1 Introduction

This project guide provides necessary information and recommendations for the application of HYUNDAI HiMSEN H27DF (Dual Fuel) generating-set (gen-set). 'HiMSEN'® is the licensed brand name of HYUNDAI's own design engine and the abbreviation of '**Hi**-Touch **M**arine & **S**tationary **E**ngine'. The HiMSEN H27DF generating sets are delivered as complete packages, an engine and a generator are mounted on a common base frame together with related auxiliary equipment.

Please note that all data and information prepared in this project guide are for guidance only and subject to revision without notice. Therefore, please contact Hyundai Heavy Industries Co., Ltd. before actual applications of the data. Hyundai Heavy Industries Co., Ltd. (HHI) will always provide the data for the installation of specific project.

Each sheet is identified by the engine type and own 'Sheet Number'. Therefore, please use engine type 'H27DF', and 'Sheet No.' for easier communications.

2.3 Engine design outline

2.3.1 General

Hyundai dual fuel engine 'HiMSEN H27DF' family have simple and smart design suitable for marine application with high reliability and performance. The key features are summarized as below :

1. Dual fuel engine can be run with liquid fuel or gaseous fuel alternatively.
2. Eco-friendly and economical engine with the lowest fuel consumption and NO_x emission which are based on the following specific designs :
 - ✓ The best air fuel ratio control
 - ✓ Optimized combustion parameters, i.e. high fuel injection pressure, piston bowl, turbocharger and intake air parts, etc.
3. Reliable and practical engine with simple, smart and robust structure.
 - ✓ A number of engine components are minimized with pipe-free design.
 - ✓ Most of the components are directly accessible for easy maintenance.
 - ✓ Maintenance concept for each parts is to be provided.
 - ✓ Feed system is fully modularized with direct accessibility.
 - ✓ Highly integrated control system.
 - ✓ Raven components are applied.
 - ✓ Free from gas leakage.
 - ✓ Up-to-date technology is adopted.

Figure 2.2 Engine design outline

2.3.2 Design of main components

Figure 2.3 Cross section drawing

2.3.3 Description of feed module

HiMSEN has a unique design of feed module for better reliability and easy maintenance such as cooling water and lubricating oil system are fully modularized into the feed module with the following key features.

- ✓ All the components of the system, for example, pumps, valves, filters and coolers are mounted on feed block without any pipe connection, which provides direct accessibility with fewer parts for easy maintenance as shown below Figure 2.4.
- ✓ Feed block has cast-in flow channels for cooling water and lubricating oil circuits, which are arranged to secure water-tight to oil space and simplified in combination with pumps and valve housings for better flow characteristics to avoid any risk of corrosion due to cavitation.

Outline of feed module

Figure 2.4 Outline of feed module

2.4 Generating-set dimension and weight

Table 2.2 Generating-set dimension and weight for 720 / 750 rpm

Engine type	Dimensions (mm)					Dry weight (ton) ²⁾	
	A	B ¹⁾	C ¹⁾	D	H	Engine ³⁾	Generating-set ⁴⁾
6H27DF	4414	2262	6676	2844	2835	21.2	30.8
7H27DF	4794	2262	7056	2844	2835	23.5	34.9
8H27DF	5311	2340	7573	2844	3241	25.1	40.5
9H27DF	5691	2262	7953	2844	3371	27.2	46.0

1. All dimensions and weight are approximate value and subject to change without prior notice.

1) : Depending on alternator.

2) : Weight including a standard alternator (Maker : HHI-EES)

3) : Without common base frame

4) : With common base frame and generator

D : Min. distance between engines

P : Free passage between the engines, width 600 mm and height 2000 mm.

H : Height exclude expansion joint length

Table 2.3 Generating-set dimension and weight for 900 / 1000 rpm

Engine type	Dimensions (mm)					Dry weight (ton) ²⁾	
	A	B ¹⁾	C ¹⁾	D	H	Engine ³⁾	Generating-set ⁴⁾
6H27DF	4414	2262	6676	2844	2835	21.2	30.8
7H27DF	4794	2262	7056	2844	3241	23.5	34.9
8H27DF	5311	2340	7651	2844	3371	25.1	40.5
9H27DF	5691	2490	8181	2844	3371	27.2	46.0

1. All dimensions and weight are approximate value and subject to change without prior notice.

1) : Depending on alternator.

2) : Weight including a standard alternator (Maker : HHI-EES)

3) : Without common base frame

4) : With common base frame and generator

D : Min. distance between engines

P : Free passage between the engines, width 600 mm and height 2000 mm.

H : Height exclude expansion joint length

2.5 Mounting

2.5.1 General

The HiMSEN generating-set consists of dual fuel engine and alternator mounted on common base frame. The common base frame is installed on resilient mounts on the foundation in the ship.

The resilient mounting for the generating-set is made with a number of rubber elements in order to isolate from vibrations between generating-set and hull structure. These rubber elements are bolted to brackets of the common base frame as shown below Figure 2.5.

Figure 2.5 Resilient mounting

2.5.2 Design of resilient mount

The quantities and position of the resilient mount are determined by the dynamic characteristics of vessel. Therefore, the final specification of the resilient mount shall be decided based on the information from vessel contractor.

2.5.3 Connections to the generating-set

Generating-set mounted on resilient mount is usually influenced by a relative motions from the hull structure. Due to the reason, any rigid fixing between generating-set and hull structure causes damages to generating-set or hull. Therefore, all connections, for example, pipes, gratings, ladders, electric wires, etc., should be flexible enough to absorb the relative movements.

2.5.4 Recommendations for seating design and adjustment

The foundation for common base frame mounting should be rigid enough to support the load from generating-set. Steel shim plates with thickness of minimum 25 mm between rubber elements and foundation are required to adjust leveling of each mount (Method 1). Additional shim plate (Minimum thickness 10 mm) can be used for adjustments (Method 2) as shown below Figure 2.6. It is also recommended to check the crankshaft deflection before starting up the engine to secure the correct adjustments of the shim plate and leveling of the generating-set.

Figure 2.6 Recommendations for seating design

2.6 Overhaul dimension

Figure 2.7 Overhaul dimension

This page is intentionally blanked

3 Performance data

3.1 Rated power for generating-set

Table 3.1 Rated power for generating-set

Engine type	Rated output at							
	720 rpm / 60 Hz		750 rpm / 50 Hz		900 rpm / 60 Hz		1000 rpm / 50 Hz	
	Engine (kWm)	Generator (kWe)	Engine (kWm)	Generator (kWe)	Engine (kWm)	Generator (kWe)	Engine (kWm)	Generator (kWe)
6H27DF	1368	1300	1422	1351	1710	1625	1860	1767
7H27DF	1596	1516	1659	1576	1995	1895	2170	2062
8H27DF	1824	1733	1896	1801	2280	2166	2480	2356
9H27DF	2052	1949	2133	2026	2565	2437	2790	2651

1. No overload operation is permissible except 10 % overload of diesel mode during official factory test only.
2. The alternator outputs are calculated for an efficiency of 95 % and a power factor of 0.8 lagging.
3. Power adjusting of dual fuel engines must be consulted to engine builder.

Reference condition

General definition of gas engine rating is specified in accordance with ISO 3046-1.

ISO condition

Turbocharger air inlet pressure : 1000 mbar

Intake air temperature : 298 K (25 °C)

L.T cooling water temperature : 298 K (25 °C)

Tropical condition

Turbocharger air inlet pressure : 1000 mbar

Intake air temperature : 318 K (45 °C)

L.T cooling water temperature : 309 K (36 °C)

3.2 Engine capacity data

Table 3.2 Engine capacity data (Diesel mode - rated power : 228 kW / cylinder at 720 rpm)

Engine MCR	Cyl.	6	7	8	9
	kW	1368	1596	1824	2052
1. Cooling capacities					
Charge air					
Heat dissipation ¹⁾	kW	468	546	624	702
Low temperature cooling water flow	m ³ /h	60	60	60	70
Low cooling water temperature, cooler in / out	°C	36 / 43	36 / 44	36 / 45	36 / 45
Lubricating oil					
Heat dissipation ^{1) 3)}	kW	225	263	300	338
Low temperature cooling water flow	m ³ /h	60	60	60	70
Low cooling water temperature, cooler in / out	°C	43 / 46	44 / 48	45 / 49	45 / 49
Cylinder jacket					
Heat dissipation ¹⁾	kW	214	249	285	321
High temperature cooling water flow	m ³ /h	60	60	60	70
High cooling water temperature, engine in / out	°C	79 / 82	78 / 82	78 / 82	78 / 82
2. Gas data ²⁾					
Combustion air consumption	kg/h	8302	9686	11070	12454
Exhaust gas flow	kg/h	8562	9989	11416	12844
Exhaust gas temperature	°C	320	320	320	320
Allowable exhaust gas back pressure, max.	mbar	30	30	30	30

Engine MCR	Cyl.	6	7	8	9
	kW	1368	1596	1824	2052

3. Heat radiation

Engine radiation ¹⁾	kW	41	48	55	62
--------------------------------	----	----	----	----	----

Alternator radiation kW (See separate data from alternator maker)

4. Starting air

Air consumption per start ⁷⁾	Nm ³	2.55	2.75	3.1	3.2
Starting air source, pressure (20 °C)	bar	30 / 15	30 / 15	30 / 15	30 / 15

5. Pump capacities

Engine driven pumps ⁴⁾

Lubricating oil pump (6 bar)	m ³ /h	82	82	94	94
High temperature cooling water pump (1 ~ 2.5 bar)	m ³ /h	60	60	60	70
Low temperature cooling water pump (1 ~ 2.5 bar)	m ³ /h	60	60	60	70

External pumps ⁵⁾

Marine diesel oil pump (head) - (8 bar)	m ³ /h	0.93	1.08	1.24	1.39
Heavy fuel oil supply pump (head) - (4 bar)	m ³ /h	0.46	0.54	0.62	0.7
Heavy fuel oil booster pump (8 bar at engine inlet, F1) ⁶⁾	m ³ /h	0.93	1.08	1.24	1.39
Pilot supply pump (6 bar at engine inlet, F9)	m ³ /h	(See 6.3 external fuel oil system)			

Remark

- 1) Under tropical condition (Turbocharger inlet air pressure 1 bar, intake air temperature 45 °C, LT-cooling water temperature 36 °C) with heat dissipation tolerance for coolers +10% / for heat recovery -15%.
- 2) Under ISO condition (ISO 3046-1:2002, Turbocharger inlet air pressure 1 bar, intake air temperature 25 °C, LT-cooling water temperature 25 °C) with flow tolerance ±5% and exhaust gas temperature tolerance ±25 °C, these data are indicative values. For each project, please contact to HHI-EMD.
- 3) Additional heat for lube oil purification should be included. (30 kJ/kWh).
- 4) Flow capacity to be within a tolerance of 0% to +10%.
- 5) Flushing oil quantity of automatic filter should be added.
- 6) Heavy fuel oil booster pump head to be designed by external system designer considering pressure loss of external system.
- 7) This value includes slow turn consumption.

Table 3.3 Engine capacity data (Gas mode - rated power : 228 kW / cylinder at 720 rpm)

Exhaust gas flow	kg/h	7821	9124	10428	11731
Exhaust gas temperature	°C	363	363	363	363
Allowable exhaust gas back pressure, max. ⁶⁾	mbar	(24)	(24)	(24)	(24)

Engine MCR	Cyl.	6	7	8	9
	kW	1368	1596	1824	2052

3. Heat radiation

Engine radiation ¹⁾	kW	41	48	55	62
--------------------------------	----	----	----	----	----

Alternator radiation kW (See separate data from alternator maker)

4. Pump capacities

Engine driven pumps ⁴⁾

Lubricating oil pump (6 bar)	m ³ /h	82	82	94	94
High temperature cooling water pump (1 ~ 2.5 bar)	m ³ /h	60	60	60	70
Low temperature cooling water pump (1 ~ 2.5 bar)	m ³ /h	60	60	60	70

External pumps ⁵⁾

Pilot supply pump (6 bar at engine inlet, F9)	m ³ /h	(See 6.3 external fuel oil system)
---	-------------------	------------------------------------

Remark

- 1) Under tropical condition (Turbocharger inlet air pressure 1 bar, intake air temperature 45 °C, LT-cooling water temperature 36 °C) with heat dissipation tolerance for coolers +10% / for heat recovery -15%.
- 2) Under ISO condition (ISO 3046-1:2002, Turbocharger inlet air pressure 1 bar, intake air temperature 25 °C, LT-cooling water temperature 25 °C) with flow tolerance $\pm 5\%$ and exhaust gas temperature tolerance ± 25 °C, these data are indicative values. For each project, please contact to HHI-EMD.
- 3) Additional heat for lube oil purification should be included. (30 kJ/kWh).
- 4) Flow capacity to be within a tolerance of 0% to +10%.
- 5) Flushing oil quantity of automatic filter should be added.
- 6) The maximum exhaust gas back pressure of gas mode is defined depending on allowable exhaust gas back pressure of diesel mode.

Lubricating oil pump (6 bar)	m ³ /h	85	85	98	98
High temperature cooling water pump (1 ~ 2.5 bar)	m ³ /h	60	60	60	70
Low temperature cooling water pump (1 ~ 2.5 bar)	m ³ /h	60	60	60	70

External pumps ⁵⁾

Pilot supply pump (6 bar at engine inlet, F9)	m ³ /h	(See 6.3 external fuel oil system)
---	-------------------	------------------------------------

Remark

- 1) Under tropical condition (Turbocharger inlet air pressure 1 bar, intake air temperature 45 °C, LT-cooling water temperature 36 °C) with heat dissipation tolerance for coolers +10% / for heat recovery -15%.
- 2) Under ISO condition (ISO 3046-1:2002, Turbocharger inlet air pressure 1 bar, intake air temperature 25 °C, LT-cooling water temperature 25 °C) with flow tolerance ±5% and exhaust gas temperature tolerance ±25 °C, these data are indicative values. For each project, please contact to HHI-EMD.
- 3) Additional heat for lube oil purification should be included. (30 kJ/kWh).
- 4) Flow capacity to be within a tolerance of 0% to +10%.
- 5) Flushing oil quantity of automatic filter should be added.
- 6) The maximum exhaust gas back pressure of gas mode is defined depending on allowable exhaust gas back pressure of diesel mode.

Figure 3.2 Cooling system arrangement

Table 3.6 Engine capacity data (Diesel mode - rated power : 285 kW / cylinder at 900 m)

Engine MCR	Cyl.	6	7	8	9
	kW	1710	1995	2280	2565
1. Cooling capacities					
Charge air					
Heat dissipation ¹⁾	kW	628	732	837	942
Low temperature cooling water flow	m ³ /h	60	60	60	70
Low cooling water temperature, cooler in / out	°C	36 / 45	36 / 46	36 / 48	36 / 48
Lubricating oil					
Heat dissipation ^{1) 3)}	kW	282	329	376	423
Low temperature cooling water flow	m ³ /h	60	60	60	70
Low cooling water temperature, cooler in / out	°C	45 / 49	46 / 51	48 / 53	48 / 53
Cylinder jacket					
Heat dissipation ¹⁾	kW	267	312	356	401
High temperature cooling water flow	m ³ /h	60	60	60	70
High cooling water temperature, engine in / out	°C	79 / 82	79 / 82	78 / 82	77 / 82
2. Gas data ²⁾					
Combustion air consumption	kg/h	10378	12108	13837	15567
Exhaust gas flow	kg/h	10703	12487	14271	16054
Exhaust gas temperature	°C	320	320	320	320
Allowable exhaust gas back pressure, max.	mbar	30	30	30	30

Engine MCR	Cyl.	6	7	8	9
	kW	1710	1995	2280	2565

3. Heat radiation

Engine radiation ¹⁾	kW	52	61	69	78
--------------------------------	----	----	----	----	----

Alternator radiation kW (See separate data from alternator maker)

4. Starting air

Air consumption per start ⁷⁾	Nm ³	2.55	2.75	3.1	3.2
Starting air source, pressure (20 °C)	bar	30 / 15	30 / 15	30 / 15	30 / 15

5. Pump capacities

Engine driven pumps ⁴⁾

Lubricating oil pump (6 bar)	m ³ /h	82	82	94	94
High temperature cooling water pump (1 ~ 2.5 bar)	m ³ /h	60	60	60	70
Low temperature cooling water pump (1 ~ 2.5 bar)	m ³ /h	60	60	60	70

External pumps ⁵⁾

Marine diesel oil pump (head) - (8 bar)	m ³ /h	1.17	1.36	1.55	1.75
Heavy fuel oil supply pump (head) - (4 bar)	m ³ /h	0.59	0.68	0.78	0.88
Heavy fuel oil booster pump (8 bar at engine inlet, F1) ⁶⁾	m ³ /h	1.17	1.36	1.55	1.75
Pilot supply pump (6 bar at engine inlet, F9)	m ³ /h	(See 6.3 external fuel oil system)			

Remark

- 1) Under tropical condition (Turbocharger inlet air pressure 1 bar, intake air temperature 45 °C, LT-cooling water temperature 36 °C) with heat dissipation tolerance for coolers +10% / for heat recovery -15%.
- 2) Under ISO condition (ISO 3046-1:2002, Turbocharger inlet air pressure 1 bar, intake air temperature 25 °C, LT-cooling water temperature 25 °C) with flow tolerance ±5% and exhaust gas temperature tolerance ±25 °C, these data are indicative values. For each project, please contact to HHI-EMD.
- 3) Additional heat for lube oil purification should be included. (30 kJ/kWh).
- 4) Flow capacity to be within a tolerance of 0% to +10%.
- 5) Flushing oil quantity of automatic filter should be added.
- 6) Heavy fuel oil booster pump head to be designed by external system designer considering pressure loss of external system.
- 7) This value includes slow turn consumption.

Table 3.7 Engine capacity data (Gas mode - rated power : 285 kW / cylinder at 900 m)

4. Pump capacities

Engine driven pumps ⁴⁾

Lubricating oil pump (6 bar)	m ³ /h	91	91	104	104
High temperature cooling water pump (1 ~ 2.5 bar)	m ³ /h	60	60	60	70
Low temperature cooling water pump (1 ~ 2.5 bar)	m ³ /h	60	60	60	70

External pumps ⁵⁾

Pilot supply pump (6 bar at engine inlet, F9)	m ³ /h	(See 6.3 external fuel oil system)
---	-------------------	------------------------------------

Remark

- 1) Under tropical condition (Turbocharger inlet air pressure 1 bar, intake air temperature 45 °C, LT-cooling water temperature 36 °C) with heat dissipation tolerance for coolers +10% / for heat recovery -15%.
- 2) Under ISO condition (ISO 3046-1:2002, Turbocharger inlet air pressure 1 bar, intake air temperature 25 °C, LT-cooling water temperature 25 °C) with flow tolerance ±5% and exhaust gas temperature tolerance ±25 °C, these data are indicative values. For each project, please contact to HHI-EMD.
- 3) Additional heat for lube oil purification should be included. (30 kJ/kWh).
- 4) Flow capacity to be within a tolerance of 0% to +10%.
- 5) Flushing oil quantity of automatic filter should be added.
- 6) The maximum exhaust gas back pressure of gas mode is defined depending on allowable exhaust gas back pressure of diesel mode.

Figure 3.4 Cooling system arrangement

3.3 Engine performance

Table 3.10 Engine performance data (Diesel mode - rated power : 228 kW / cylinder at 720 rpm)

Performance data		Engine load (%)				
		110	100	90	75	50
1. Cylinder data						
Cylinder output	kW	251	228	205	171	114
Mean effective pressure	bar	22.1	20.1	18.1	15.1	10.1
2. Combustion air data ^{1), 4)}						
Mass flow	kg/kWh	5.8	6.1	6.2	6.5	6.9
Air temperature after cooler	°C	50	50	50	50	50
3. Exhaust gas data ^{1), 4)}						
Mass flow	kg/kWh	6.0	6.3	6.4	6.7	7.1
Gas temperature after turbine	°C	325	320	315	310	342
4. Heat balance data ²⁾						
Charge air	kJ/kWh	1260	1230	1215	1220	1260
Lubricating oil	kJ/kWh	595	595	615	700	980
Jacket cooling water	kJ/kWh	550	565	575	605	825
Exhaust gas	kJ/kWh	2230	2315	2455	2715	3400
Radiation	kJ/kWh	95	110	120	130	185
5. Specific fuel oil consumption ^{3), 4)}						
Specific fuel oil consumption	g/kWh	192	190	191	194	203

Remark

Reference condition is based on ISO 3046-1:2002 (turbocharger air inlet pressure 1 bar, intake air temperature 25 °C, L.T cooling water temperature 25 °C). The above values are based on IMO Tier II emission level on diesel mode without selective catalyst reduction operation.

- 1) Mass flow tolerance $\pm 5\%$, temperature tolerance $\pm 25^{\circ}\text{C}$ ($50\% < \text{load} \leq 110\%$).

Mass flow tolerance $\pm 10\%$, temperature tolerance $\pm 35^{\circ}\text{C}$ ($\text{Load} \leq 50\%$).

- 2) Heat dissipation tolerance $+ 10\%$ for cooler, $- 15\%$ for heat recovery.
Additional heat for lube oil purification should be included. (30 kJ/kWh).

- 3) Specific fuel oil consumption tolerance $+ 5\%$ at 100 % load.

Engine driven pumps attached : lubricating oil pump, high temperature cooling water pump, low temperature cooling water pump.

Specific fuel oil consumption includes the pilot oil consumption and excludes clean leakage fuel oil.

Main fuel oil based on marine diesel oil, lower calorific value 42700 kJ/kg and Pilot fuel oil based on marine gas oil, lower calorific value 42700 kJ/kg.

Specific fuel oil consumption is warranted at 100 % engine load without selective catalyst reduction operation.

- 4) When an engine is operated with exhaust gas after-treatment system (for example: SCR), the values may change to ensure the proper operation of after-treatment system.

Table 3.11 Engine performance data (Gas mode - rated power : 228 kW / cylinder at 720 rpm)

Performance data		Engine load (%)				
		110	100	90	75	50
1. Cylinder data						
Cylinder output	kW	-	228	205	171	114
Mean effective pressure	bar	-	20.1	18.1	15.1	10.1
2. Combustion air data ^{1), 4)}						
Mass flow	kg/kWh	-	5.5	5.6	5.8	6.6
Air temperature after cooler	°C	-	50	50	50	50
3. Exhaust gas data ^{1), 4)}						
Mass flow	kg/kWh	-	5.7	5.8	6.0	6.8
Gas temperature after turbine	°C	-	363	369	380	429
4. Heat balance data ²⁾						
Charge air	kJ/kWh	-	1100	1020	885	610
Lubricating oil	kJ/kWh	-	595	610	675	875
Jacket cooling water	kJ/kWh	-	555	560	585	715
Exhaust gas	kJ/kWh	-	2360	2500	2700	3105
Radiation	kJ/kWh	-	110	115	120	160
5. Fuel consumption ^{3), 4)}						
Specific fuel gas consumption	kJ/kWh	-	7763	7907	8477	9568
Specific pilot oil consumption	g/kWh	-	3.2	4.1	5.0	7.2
Total heat rate	kJ/kWh	-	7900	8081	8690	9875

Remark

Reference condition is based on ISO 3046-1:2002 (turbocharger air inlet pressure 1 bar, intake air temperature 25 °C, L.T cooling water temperature 25 °C). The above values are based on IMO Tier III emission level on gas mode without selective catalyst reduction operation.

- 1) Mass flow tolerance $\pm 5\%$, temperature tolerance $\pm 25^{\circ}\text{C}$ ($50\% < \text{load} \leq 110\%$).
Mass flow tolerance $\pm 10\%$, temperature tolerance $\pm 35^{\circ}\text{C}$ (Load $\leq 50\%$).
- 2) Heat dissipation tolerance $+ 10\%$ for cooler, $- 15\%$ for heat recovery.
Additional heat for lube oil purification should be included. (30 kJ/kWh).
- 3) Total heat rate tolerance $+ 5\%$ at 100 % load.
Engine driven pumps attached : lubricating oil pump, high temperature cooling water pump, low temperature cooling water pump.
Fuel gas based on natural gas, lower heating value 36 MJ/Nm³ (≈ 50 MJ/kg), min. methane number (MN) 80.
The methane number of the fuel gas is to be calculated by using " AVL Methane version 3.20 " of AVL's software.
Pilot fuel oil based on marine diesel oil, lower calorific value 42700 kJ/kg.
Warranted total heat rate at 100% load only.
- 4) When an engine is operated with exhaust gas after-treatment system (for example: SCR), the values may change to ensure the proper operation of after-treatment system.

Table 3.12 Engine performance data (Diesel mode - rated power : 237 kW / cylinder at 750 rpm)

Performance data		Engine load (%)				
		110	100	90	75	50
1. Cylinder data

- 3) Total heat rate tolerance $+ 5\%$ at 100 % load.
Engine driven pumps attached : lubricating oil pump, high temperature cooling water pump, low temperature cooling water pump.
Fuel gas based on natural gas, lower heating value 36 MJ/Nm³ (≈ 50 MJ/kg), min. methane number (MN) 80.
The methane number of the fuel gas is to be calculated by using " AVL Methane version 3.20 " of AVL's software.
Pilot fuel oil based on marine diesel oil, lower calorific value 42700 kJ/kg.
Warranted total heat rate at 100% load only.
- 4) When an engine is operated with exhaust gas after-treatment system (for example: SCR), the values may change to ensure the proper operation of after-treatment system.

Table 3.14 Engine performance data (Diesel mode - rated power : 285 kW / cylinder at 900 rpm)

Performance data		Engine load (%)				
		110	100	90	75	50
1. Cylinder data						
Cylinder output	kW	314	285	257	214	143
Mean effective pressure	bar	22.1	20.1	18.1	15.1	10.1
2. Combustion air data ^{1), 4)}						
Mass flow	kg/kWh	5.8	6.1	6.2	6.5	6.9
Air temperature after cooler	°C	50	50	50	50	50
3. Exhaust gas data ^{1), 4)}						
Mass flow	kg/kWh	6.0	6.3	6.4	6.7	7.1
Gas temperature after turbine	°C	304	298	295	290	322
4. Heat balance data ²⁾						
Charge air	kJ/kWh	1330	1320	1310	1325	1470
Lubricating oil	kJ/kWh	590	595	615	705	1015
Jacket cooling water	kJ/kWh	545	565	575	610	850
Exhaust gas	kJ/kWh	2120	2225	2360	2645	3465
Radiation	kJ/kWh	95	110	120	130	190
5. Specific fuel oil consumption ^{3), 4)}						
Specific fuel oil consumption	g/kWh	192	190	191	194	203

Remark

Reference condition is based on ISO 3046-1:2002 (turbocharger air inlet pressure 1 bar, intake air temperature 25 °C, L.T cooling water temperature 25 °C). The above values are based on IMO Tier II emission level on diesel mode without selective catalyst reduction operation.

- 1) Mass flow tolerance $\pm 5\%$, temperature tolerance $\pm 25^{\circ}\text{C}$ ($50\% < \text{load} \leq 110\%$).

Mass flow tolerance $\pm 10\%$, temperature tolerance $\pm 35^{\circ}\text{C}$ ($\text{Load} \leq 50\%$).

- 2) Heat dissipation tolerance $+ 10\%$ for cooler, $- 15\%$ for heat recovery.
Additional heat for lube oil purification should be included. (30 kJ/kWh).

- 3) Specific fuel oil consumption tolerance $+ 5\%$ at 100 % load.

Engine driven pumps attached : lubricating oil pump, high temperature cooling water pump, low temperature cooling water pump.

Specific fuel oil consumption includes the pilot oil consumption and excludes clean leakage fuel oil.

Main fuel oil based on marine diesel oil, lower calorific value 42700 kJ/kg and Pilot fuel oil based on marine gas oil, lower calorific value 42700 kJ/kg.

Specific fuel oil consumption is warranted at 100 % engine load without selective catalyst reduction operation.

- 4) When an engine is operated with exhaust gas after-treatment system (for example: SCR), the values may change to ensure the proper operation of after-treatment system.

Table 3.15 Engine performance data (Gas mode - rated power : 285 kW / cylinder at 900 rpm)

Performance data		Engine load (%)				
		110	100	90	75	50
1. Cylinder data						
Cylinder output	kW	-	285	257	214	143

Fuel gas based on natural gas, lower heating value 36 MJ/Nm³ (≈ 50 MJ/kg), min. methane number (MN) 80.

The methane number of the fuel gas is to be calculated by using " AVL Methane version 3.20 " of AVL's software.

Pilot fuel oil based on marine diesel oil, lower calorific value 42700 kJ/kg.

Warranted total heat rate at 100% load only.

- 4) When an engine is operated with exhaust gas after-treatment system (for example: SCR), the values may change to ensure the proper operation of after-treatment system.

3.4 Exhaust gas emission

3.4.1 General

HiMSEN H27DF is designed for environment-friendly engine and complies with the IMO NO_x emission limits with low fuel consumption and less smoke.

Typical composition of exhaust gas emission in volume ratio at full load are as follows:

Table 3.18 Typical compositions of exhaust gas emission

Typical exhaust compositions	Volume[%]
Nitrogen, N ₂	approx. 73
Oxygen, O ₂	approx. 13
Carbon Dioxide, CO ₂	approx. 5
Water (Vapor), H ₂ O	approx. 6
Argon, Ar	approx. 1
Soot, Ash, NO _x , CO, HC, etc.	residue

Residue is little in amount but ecologically critical. Therefore, a careful attention on the treatment of fuel oil shall be required for engine operating conditions.

If there is no special requirements from customer regarding the exhaust gas emission, HiMSEN Generating-set shall be delivered with optimized performance conditions fulfilling the MARPOL 73/78 ANNEX VI, Regulation 13 of value of NO_x emissions.

Therefore, it is strongly requested to contact the engine maker if there are any further requirements regarding exhaust gas emission or special operating conditions.

3.4.2 Engine international air pollution prevention (EIAPP) certificates

The Engine International Air Pollution Prevention (EIAPP) certificate is related to NO_x emissions. If an engine complies with the NO_x emission limits defined in regulation 13 of Annex VI, the EIAPP certificate with approved NO_x technical file shall be issued by the administration or organization on behalf of the administration. Those are necessary for renewal of EIAPP certificate through the on-board NO_x verification. The approved NO_x technical file and EIAPP certificate shall accompany the engine throughout its life and shall be available at all times on the ship.

IMO tier II and tier III limits (MARPOL ANNEX VI (73/78))

NO_x Emission from marine diesel engine test Cycle D2
In accordance with ISO 8178-4 and IMO NO_x technical code

Figure 3.5 IMO tier II and tier III limits

3.5 Power de-rating diagram

3.5.1 Gas operation

De-rating due to suction air temperature and altitude

Engine output power at maximum continuous rating shall be reduced depending on the suction air temperature and site altitude.

NOx : IMO Tier III

Charge air coolant temperature : 35 °C

Figure 3.6 De-rating due to suction air temperature and altitude

1. Minimum suction air temperature is 5 °C
2. Temperatures given above are maximum (continuous) operating temperature at site.
3. For intake air temperatures above 40 °C or charge air coolant temperatures above 36 °C, please contact HHI-EMD.
4. All design modifications related to the combustion may change characteristics of power de-rating. For example; turbocharger specification, compression ratio of cylinder, external exhaust gas system and etc. Beside the power de-rating factors (ambient condition, charge air coolant, the fuel gas properties, the fuel gas supply condition and the supply gas pressure), can reduce the engine maximum power.

Example

Cooling water temperature before charge air cooler : 35 °C

Suction air temperature : 30 °C

Site altitude : 1000 m

From the power de-rating diagram, the power de-rating factor at actual operating condition is 0.96 therefore the engine output power at actual operating condition should be de-rated to the 96 % of the standard engine rated power.

The power de-rating diagram of dual fuel engine is usually determined by gas mode de-rating. Therefore, it has been evaluated for gas mode de-rating and the de-rating factors of diesel mode is not provided.

Minimum de-rating due to charge air temperature and methane number (MN)

Engine output power at maximum continuous rating shall be reduced depending on the charge air temperature and methane number.

Figure 3.7 Minimum de-rating due to charge air temperature and methane number

100 % load operation of gas mode is possible when operating with min MN 70 gas fuel and below 45 °C of charge air temperature. In the case, the pilot oil consumption and total heat rate are permanently changed in gas mode operation.

De-rating due to gas lower calorific value (LCV) and gas feed pressure

Engine output power at maximum continuous rating shall be reduced depending on the gas lower heating value and gas feed pressure.

Figure 3.8 De-rating due to gas lower calorific value and gas feed pressure

Engine output power at maximum continuous rating shall be reduced depending on the charge air coolant temperature.

Figure 3.9 De-rating due to charge air coolant temperature

Engine output power at maximum continuous rating shall be reduced depending on the air inlet temperature.

Figure 3.10 De-rating due to air inlet temperature

Engine output power at maximum continuous rating shall be reduced depending on the air pressure.

Figure 3.11 De-rating due to air pressure

Engine output power at maximum continuous rating shall be reduced depending on the anti-freezing coolant volume

Figure 3.12 De-rating due to contents of anti-freezing coolant

When using anti-freezing coolant inevitably, it is recommended to use up to 55 % maximum, because using anti-freezing coolant more than 55 % of the total mixture does not affect further decrease of freezing point.

Table 3.19 Anti-freezing coolant, fresh water, freezing points

Anti-freezing coolant (Volume %)	20	25	30	35	40	45	50	55
Fresh water (Volume %)	80	75	70	65	60	55	50	45
Freezing Points (°C)	-10.5	-13.5	-16.5	-20.5	-26.5	-31.5	-37.5	-43.5

3.6 Correction of fuel oil consumption

3.6.1 Correction of ambient condition

Specific Fuel Oil Consumption (SFOC) is referred to the ISO 3046-1 standard condition in normally.

However, for the condition other than ISO 3046-1:2002 standard condition, the SFOC at maximum continuous rating can be estimated according to the below formula.

$$\text{SFOC}_{\text{amb}} = \text{SFOC}_{\text{ISO}} \times \text{dSFOC}$$

$$\text{dSFOC} = [100 + (T_{\text{intake}} - 25) \times 0.05 - (P_{\text{amb}} - 1000) \times 0.007 + (T_{\text{cw}} - 25) \times 0.07] / 100 \times (42700 / \text{LCV})$$

Where :

SFOC_{amb} (g/kWh) : Specific fuel oil consumption at actual operating condition

SFOC_{ISO} (g/kWh) : Specific fuel oil consumption at ISO 3046-1 standard condition

T_{intake} (°C) : Intake air temperature at actual operating condition

P_{amb} (mbar) : Turbocharger inlet air pressure at actual operating condition

T_{cw} (°C) : Cooling water temperature before charge air cooler at actual operating condition

LCV (kJ/kg) : Lower calorific value of the fuel oil

Example,

Intake air temperature (T_{intake}) : 30 °C, P_{amb} : 1000 (mbar)

Cooling water temperature (T_{cw}) : 30 °C

Lower calorific value (LCV) : 42700 kJ/kg

SFOC_{ISO} : 183 g/kWh at 720 rpm, maximum continuous rating

then, $\text{dSFOC} = 1.006$ and the SFOC at site condition will be increased to 184.1 g/kWh.

3.6.2 Clean leak fuel oil

Clean leak fuel oil (recycling fuel oil) during engine operation is subtracted from measured fuel oil consumption.

(Refer to 6.2 Internal fuel oil system)

$$\text{FOC}_{\text{amb}} = \text{FOC} - \text{clean leak fuel oil}^*)$$

*) The FOC and clean leak fuel oil (kg/h) are measured over minimum 10 mins.

3.6.3 Correction of additional fuel oil consumption

If additional devices are attached on the engine or operation fuel is changed, the specific fuel oil consumption at maximum continuous rating will be increased as follows approximately:

Table 3.20 Correction of additional fuel consumption

Item	Additional SFOC [g/kWh]
Lubricating oil pump	+ 2
Low temperature cooling water pump.	+ 1
High temperature cooling water pump	+ 1
Fuel oil feed pump	Contact to HHI-EMD
Charge air pressure control device	Contact to HHI-EMD
Operation with marine gas oil	+ 2
500 mmWC > Exhaust gas back pressure after turbine > 300 mmWC	+ 0.5 / 100 mmWC

When low and high temperature cooling water pump is attached on engine,
Additional specific fuel oil consumption by water pump

$$= \text{Additional specific fuel oil consumption at 100 \% load} \times \left(\frac{100}{\text{load}} \right)^x \times \left(\frac{\text{actual rpm}}{\text{nominal rpm}} \right)^3 \text{ g/kWh}$$

When lubricating oil pump is attached on engine,

Additional specific fuel oil consumption by lubricating pump

$$= \text{Additional specific fuel oil consumption at 100 \% load} \times \left(\frac{100}{\text{load}} \right)^x \times \left(\frac{\text{actual rpm}}{\text{nominal rpm}} \right) \text{ g/kWh}$$

Table 3.21 Additional specific fuel oil consumption of each load

Load	100 ~ 25 %	Under 25 %
x	1.15	1.28

3.7 Correction of fuel gas consumption

3.7.1 General

Correction for ambient condition (Gas operation)

Heat rate of the gas operation normally refers to the ISO 3046-1 standard condition.

However, for the condition other than ISO 3046-1:2002 standard condition, the heat rate at maximum continuous rating can be estimated according to the below mentioned formula.

First, there is a relationship between the Heat Rate and the Efficiency, the heat rate is the inverse of the efficiency.

$$\text{Heat Rate (kJ/kWh)} = \text{Thermal Energy Input (kJ/h)*} / \text{Engine Output (kW)}$$

$$\text{Efficiency [\%]} = 3600 / \text{Heat Rate [kJ/kWh]} \times 100$$

$$\text{Eff}_{\text{amb}} = \text{Eff}_{\text{ISO}} \times d_{\text{Eff}}$$

$$d_{\text{Eff}} = [100 - (T_{\text{intake}} - 25) \times 0.021 - (1000 - P_{\text{amb}}) \times 0.0025 - (T_{\text{charge}} - 45) \times 0.008] / 100$$

where :

Eff_{amb} : Engine efficiency at actual operating condition [%]

Eff_{ISO} : Engine efficiency at ISO 3046-1 standard condition [%]

d_{Eff} : Deviation of the efficiency

T_{intake} : Intake air temperature at actual operating condition [°C]

P_{amb} : Ambient air pressure at actual operating condition [mbar]

T_{charge} : Charged air temperature after charge air cooler(CAC) at actual operating condition [°C]

Notice)

- 1) Maximum value of d_{Eff} is 1.
- 2) Between ISO and ambient condition, same operating parameters must be used.
- 3) If there is a change of main component, this correction should be updated.
- 4) The Heat Rate is a term commonly used for consumption of thermal energy in gaseous fuels, LCV (Lower Calorific Value) of gaseous fuel is not corrected.

Example,

Intake air temperature (T_{intake}) : 30 °C

P_{amb} : 990 [mbar]

Charge air temperature(T_{charge}) : 47 °C

Eff_{ISO} : 48.38 [%] at 720[rpm], MCR (Total Heat rate : 7,441 [kJ/kWh])

then, $d_{\text{Eff}} = 0.9985$ and the efficiency (Eff_{amb}) at site condition will be decreased to 48.31[%]
for the heat rate at site condition will be increased to 7,452 [kJ/kWh].

*) Remark

Fuel gas consumption should be measured at the point of stable operation without any leaks on fuel gas line and without any gas ventilation from gas supply - pressure regulation system.

3.7.2 Calculation of fuel gas flow

Since the heat rate is defined by the amount of thermal energy consumption for gas operation, the calorific value and density of fuel gas are necessary in order to calculate the flow consumption amount.

Volume flow or mass flow of gas consumption are simply calculated by LCV and density of the fuel gas.

Volume flow of fuel gas [Nm³/h] = Heat rate [kJ/kWh] x Engine output [kW] / LCV [kJ/Nm³]
Mass flow of fuel gas [kg/h] = Volume flow of fuel gas [Nm³/h] x Density [kg/Nm³]

3.7.3 Correction of additional fuel gas consumption

If additional devices are attached on the engine or operation condition is changed, the heat rate for MCR will be increased approximately as follows:

Table 3.22 Correction of additional fuel gas consumption

Item	Additional heat [kJ/kWh]
Lubricating oil pump	+ 86
Low temperature cooling water pump.	+ 43
High temperature cooling water pump	+ 43
Fuel oil feed pump	Contact to HHI-EMD
Charge air pressure control device	Contact to HHI-EMD
400 mmWC > Exhaust gas back pressure after turbine > 240 mmWC (Gas mode*)	+ 120 Per 80 mmWC of Gas mode

Remark)

*) The exhaust back pressure of the gas mode is defined as a value changed over from the diesel mode.
The maximum back pressure of gas mode is approximately the back pressure of diesel mode x 0.8.

LT & HT Pump attached engine(Genset & Propulsion)

Additional heat rate by water pump =

Additional heat rate at 100% load * (100/Load)^x * (actual rpm/nominal rpm)³ [g/kWh]

LO Pump attached engine(Genset & Propulsion)

Additional heat rate by LO pump =

Additional heat rate at 100% load * (100/Load)^x * (actual rpm/nominal rpm) [g/kWh]

Table 3.23 Additional specific fuel gas consumption of each load

Load	100 ~ 25 %	Under 25 %
x	1.15	1.28

3.8 Correction of exhaust gas temperature

3.8.1 General

Correction for ambient condition

Exhaust gas temperature after turbine is referred to ISO 3046-1 standard condition in normally.

However, for the condition other than ISO 3046-1 standard condition, the exhaust gas temperature after turbine could be estimated according to the below formula :

$$T_{\text{exh.amb}} = T_{\text{exh.ISO}} + dT_{\text{exh}}$$

$$dT_{\text{exh}} = (T_{\text{intake}} - 25) \times 1.5 + (T_{\text{cw}} - 25) \times 0.7$$

where :

$T_{\text{exh.amb}}$ (°C) : Exhaust gas temperature after turbine at actual operating condition

$T_{\text{exh.ISO}}$ (°C) : Exhaust gas temperature after turbine at ISO 3046-1 standard condition

dT_{exh} (°C) : Deviation of the exhaust gas temperature after turbine

T_{intake} (°C) : Intake air temperature at actual operating condition

T_{cw} (°C) : Cooling water temperature before charge air cooler at actual operating condition

Example,

Intake air temperature (T_{intake}) : 35 °C

Cooling water temperature (T_{cw}) : 35 °C

$T_{\text{exh.ISO}}$: 290 °C at 720 rpm, maximum continuous rating

then, $dT_{\text{exg}} = 22$ °C and the $T_{\text{exh.amb}}$ at actual operating condition will be increased to 312 °C.

1) Moment of Inertia : $GD^2 = 4 \times J$ (kgm²)

2) Recommended values, the case of different MOI should be confirmed by a torsional vibration analysis.

4.3 Noise measurement

4.3.1 General description

The airborne noise of the engine is defined as a sound pressure level according to ISO 6798 and ISO 8528-10. The total 19 point at distance 1 m away from the engine surface at full load should be measured. The values are averaged with A-weighting in one octave band. In the octave level diagram, the minimum and maximum octave levels of all measuring points have been linked by results. The data can be changed, depending on the acoustical properties of the environment and the number of cylinder

900 rpm (Diesel mode)

5 Operation and control system

5.1 Engine operation

5.1.1 General

HiMSEN DF engine can provide the operator the flexibility of fuel supply. The operator can choose the fuel mode depending on the situation of vessel if predefined condition is satisfied. When predefined abnormality is monitored during gas mode operation, fuel mode is automatically changeover to diesel (or backup) mode for safe engine operation.

5.1.2 Engine fuel mode

Diesel mode

- ✓ Main fuel oil and pilot fuel oil system active.
- ✓ Main fuel oil is injected by conventional injection system and the fuel oil actuator adjusts the amount of fuel injection.
- ✓ Pilot fuel oil system is electrically controlled by common rail system.
- ✓ When manually selected or gas mode operation is not available (gas trip condition).

Gas mode

- ✓ Gas fuel and pilot fuel oil system active.
- ✓ Gas fuel is electronically injected by gas admission valve and the amount of gas injection is adjusted by its opening duration.
- ✓ When manually selected.
- ✓ MSS (Methane slip solution) operation¹⁾ for reducing CH₄ slip.

Backup mode operation

- ✓ Only main fuel oil system active. (Heavy fuel oil / marine diesel oil / marine gas oil)
- ✓ In heavy fuel oil application, maximum backup mode operation time : 30 minutes
- ✓ In marine diesel oil, marine gas oil application, maximum backup mode operation time : 10 hours
- ✓ In case, backup mode operation exceeds the above specified time, abnormal conditions (blocking of injection hole or wear) of the micro pilot injector may occur by backup mode which not activate pilot injection system. After backup mode operation, Engine & Auxiliary facility check is required if necessary.

1) Description for MSS operation is excluded in this document.
Contact HHI-EMD for detailed information of MSS operation.

Figure 5.1 Engine fuel mode

The HiMSEN DF Engine Control System classifies fuel operation into three distinct modes, clearly defining the transition from the operator's command to the engine's actual operating status:

- **Selected Fuel Mode:** This represents the target fuel mode requested by the operator. Engine Control System evaluates digital inputs to define fuel mode based on the current engine operation mode (Local or Remote).
- **Applied Fuel Mode:** Applied Fuel Mode is distinguished based on the Selected Fuel Mode combined with the current monitoring status, such as Gas trip or Pilot trip. This mode determines the specific start and stop sequences and activates other necessary functions and sequences.
- **Active Fuel Mode:** Active Fuel Mode represents the fuel currently being burned in the engine cylinders. Engine Control System switches this mode to "Gas Mode" as soon as gas starts burning, regardless of whether it is combined with main fuel oil. Furthermore, the Active Fuel Mode is used to enable or disable specific monitoring functions as defined in the approval drawing of the Alarm list.

Table 5.1 Selected Fuel Mode

Operation mode	Digital signal	Selected Fuel mode	Priority
Local and Remote	DI-024 Blackout start mode request (Contact closed)	Blackout mode start	Highest
	DI-023 Backup mode request (Optional) (Contact closed)	Backup mode	
Remote	DI-021 Diesel mode request (Contact closed)	Diesel mode	
	DI-022 Gas mode request (Contact closed)	Gas mode	Lowest
Local	LOP S7 Diesel / Gas mode (Contact open)	Diesel mode	
	LOP S7 Diesel / Gas mode (Contact closed)	Gas mode	Lowest

5.1.3 Starting condition

Normal starting condition

Lubricating oil

- ✓ Continuous pre-lubrication is required
- ✓ Temperature : over 40 °C (Preheated)

Cylinder cooling water

- ✓ Start on marine diesel oil / marine gas oil : over 40 °C (Preheated)
- ✓ Start on heavy fuel oil : over 60 °C (Preheated)

Combustion Air

- ✓ Intake air temperature : between 0 °C and 45 °C

Fuel oil (Marine diesel oil / marine gas oil or heavy fuel oil)

- ✓ Pre-circulation is required
- ✓ Engine inlet viscosity : 12 ~ 18 cSt (Heavy fuel oil)
2 ~ 14 cSt (Marine diesel oil / marine gas oil)

Fuel gas

- ✓ Temperature : 0 ~ 50 °C
- ✓ Refer to Figure 5.2 for required gas pressure

Emergency cold starting condition

Fuel oil : only marine diesel oil / marine gas oil is acceptable

Cooling water : minimum 15 °C

Lubricating oil : minimum 10 °C, pre-lubricated
(Approx.1000 cSt based on SAE 40)

Intake air temperature : minimum 0 °C

Required gas supply pressure

Gas supply pressure can be interpolated in case of 36 MJ/Nm^3 and 28 MJ/Nm^3 of gas lower heating value as Figure 5.2. The gas supply pressure at gas regulating unit inlet, G11 (See the diagram Figure 6.6) should be considered as followings;

- 1) Pressure loss at the GRU (Generally, 0.6 bar can be used.),
- 2) Pressure loss in the pipe between GRU and engine.

The fuel gas specification should be satisfied the requirements in the Table 6.18. Admissible gas supply pressure fluctuation : Less than 0.1 bar/sec of pressure variation (peak ± 0.5 bar) can be absorbed in gas regulating unit and no effect on engine operation. The supplied gas pressure with deviation should be set higher than the required gas pressure at corresponding engine operating condition.

Figure 5.2 Gas supply pressure at engine inlet

5.1.4 Engine start

Engine start ready

Engine start ready condition is indicated in local and remote. It is recommended that engine is to be in warm condition before start.

Start block signals:

- ✓ PT621/PT622 Lube oil pressure engine inlet low *
- ✓ PT621/PT622 Lube oil pressure engine inlet, both sensor failure *
- ✓ PT40 Starting air pressure engine inlet low (Option) *
- ✓ TE75 HT water temperature engine inlet low (Option) *
- ✓ Turning gear engaged
- ✓ Slow turning failure *
- ✓ Exhaust gas ventilation in progress *
- ✓ PT89-2 (or PT89) Inert gas pressure too low during engine stop sequence (Exhaust gas natural ventilation in progress)
- ✓ Start block in Test mode (Aux-Test mode)
- ✓ Start block from remote system (DI-004 Remote start blocking signal)

: The conditions marked with an asterisk () are overridden when blackout start mode is activated. Please refer to the section of "Engine start as request of black-out start mode" for further details.

Engine start at different fuel mode

Main starting valve is installed in engine side and operated by compressed air and controlled by pneumatic solenoid valve. (See the diagram Figure 9.1)

Start from each fuel mode is available when predefined condition for selected fuel mode is satisfied.

Slow turning

Slow turning is a phase of the engine cranking process, performed under predefined conditions at reduced torque and speed without fuel injection. The Engine Control System verifies that the engine rotates for the predefined number of revolutions within the specified time. This sequence ensures that no foreign liquids remain in the combustion chamber, preventing potential mechanical damage. Slow turning can be applied as part of the start sequence or during engine standstill, so called "cyclic slow turning".

Slow turning during engine start

Slow turning is performed during the engine start sequence under the following conditions:

- Engine start in local operation (Control mode = local operation)
- Engine start in remote operation with digital signal "DI-008 Stand-by signal" = Inactive

If slow turning fails during the engine start sequence, digital signal "DO-004 Engine start failure" is triggered along with the relevant alarms, and the engine start sequence is immediately aborted.

Slow turning during engine start is skipped in case that cyclic slow turning has been successfully completed prior to the engine start or the elapsed time since the last engine operation is shorter than the predefined time. (Typically, 24 hours)

Cyclic slow turning

Cyclic slow turning is applied when the engine is in standstill under the following conditions:

- Engine in stopped condition (Engine state = "READY")
- Control mode = Remote operation
- Digital signal "DI-008 Stand-by signal" = active (Contact close)

Once above all conditions are satisfied, cyclic slow turning is performed periodically (Typically every 24 hours).

Pilot FO injection system test (Conventional)

Prior to gas fuel admission, Pilot FO injection system check sequence must be successfully completed. This sequence is performed during the engine start at the idle speed (typically 500 rpm), where the engine control system monitors each cylinder's combustion status and compares these values against the average value while keeping the engine running only on pilot fuel oil injection with the main fuel oil injection disabled. If the combustion status of specific cylinder drops below the predefined value from average during the period of time, Gas trip is triggered and transfer to gas mode is blocked.

Alternative Pilot FO injection system test

When all cylinder pressure sensors are healthy and conventional Pilot FO injection system test is successfully completed, Alternative Pilot FO injection system test can be performed while the engine is in load operation in the event of Pilot trip. Therefore, this function does not require engine restart to check integrity of pilot injection system. Alternative Pilot FO injection system test can be activated when a reset is activated while "Gas trip: Gas mode block due to former backup mode operation" alarm is active. At that moment, no other Pilot trip or Gas trip alarms should be pending. If this test is successfully completed, gas mode operation becomes available.

The engine control system monitors the combustion status of each cylinder following Pilot FO injection. To ensure a stable pilot injection system check, the engine's load fluctuation should be maintained within $\pm 5\%$ of rated load.

In the event of a blackout start, an exception is applied to the requirement for a successful conventional Pilot FO injection system check. This allows gas mode operation to become available without requiring an engine restart once the blackout recovery process is completed.

Engine start at diesel mode

Slow turning is performed depending on the predefined conditions. During the startup phase, initial combustion is regulated by the fuel oil actuator according to the predefined profile. The pilot injection system is activated once the engine reaches the predefined speed. The pilot injection system check sequence is subsequently performed at the idle speed (typically 500rpm). The generator circuit breaker can be closed approximately one minute after the engine has started. This one-minute period is calculated excluding the time required for slow turning. Slow turning requires an additional 45 seconds approximately.

Engine start at gas mode

The gas leakage test for the Gas Regulating Unit (GRU) is performed first. If this test fails or is not completed within the predefined time, Gas trip is triggered and the engine automatically attempts to start in the diesel mode. Following a successful gas leakage test, the engine start sequence is very similar to the diesel mode process up to the pilot injection system check sequence. Upon successful completion of the pilot injection system check at the idle speed, the main fuel is changed over to gas and simultaneously the engine speed ramps up from the idle speed to the rated speed. The generator circuit breaker can be closed approximately three minutes after the engine has started. This three-minute period is calculated excluding the time required for slow turning. Slow turning requires an additional 45 seconds approximately.

Engine start at backup mode

The backup mode start sequence is applied upon the occurrence of Pilot trip, where the pilot injection system is disabled throughout the entire startup process. Slow turning is performed depending on the predefined conditions. Unlike other operation modes, the pilot injection system check sequence is bypassed as the pilot injection system remains inactive. The generator circuit breaker can be closed approximately 45 seconds after the engine has started. These 45 seconds period is calculated excluding the time required for slow turning. Slow turning requires an additional 45 seconds approximately.

Engine start as request of black-out start mode

Upon a request for black-out start mode, specific start block conditions are ignored and the start sequence is optimized for rapid startup. Slow turning is skipped regardless of operational conditions, and the pilot fuel injection system is disabled throughout the entire startup process. Unlike other operation modes, the pilot injection system check sequence is bypassed as the pilot injection system remains inactive. The engine speed is immediately ramped up to the rated speed as rapidly as possible to ensure the shortest blackout recovery time. The generator circuit breaker can be closed approximately 20 seconds after the engine start sequence starts.

Below start block conditions are overridden and pilot injection system is disabled:

- PT621/PT622 Lube oil pressure engine inlet low (overridden for 10 minutes after lube oil pressure is below the start block condition)
- PT621/PT622 Lube oil pressure engine inlet, both sensor failure
- PT40 Starting air pressure engine inlet low (if applied)
- TE75 HT water temperature engine inlet low (if applied)
- Slow turning failure
- Exhaust gas ventilation in progress

✓ Figure 5.3 Engine start at different fuel mode

5.1.5 Restriction for low load operation

Idle running

- ✓ Less than 5 minutes of idle running is permitted if the engine is going to stop.
- ✓ Maximum 30 minutes of idle running is permitted if the engine is loaded after idle running.

Long term low load operation

Gas and marine diesel oil and marine gas oil operation

- ✓ Over 15 % load operation : no restriction
- ✓ Below 15 % load operation : load up over 70 % load at every limited time at corresponding load in Figure 5.4

Heavy fuel oil operation

- ✓ Over 20 % load operation : no restriction
- ✓ Below 20 % load operation : load up over 70 % load at every limited time at corresponding load in Figure 5.4

Duration of flushing operation (See Figure 5.4)

'Time limits for low load operation' (left) shows admissible operation time at certain load, and 'Duration of flushing operation' (right) shows the required time for duration that engine operates at not less than 70 % of full load in order for burning the deposits away.

Example

1. Time limits for low load operation (line A, A')
At 10 % of full load, heavy fuel oil operation is permissible for about 17 hours (line A), whereas marine diesel oil/marine gas oil operation for 37 hours. (line A').
2. Duration of flushing operation (line B, B')
Engine should be operated for roughly 1.15 hours (heavy fuel oil) and 0.75 hours (marine diesel oil / marine gas oil) at not less than 70 % of full load.

Figure 5.4 Time limits for low load operation

5.1.6 Engine load-up

HiMSEN engines fulfill all requirements regarding the load application of all major classification societies and IACS at diesel mode.

At gas mode, both continuous and step by step load up should be taken carefully for stable and safe operation of engine.

The engine has to be in warm condition for normal or emergency load up. When the engine is in cold condition, the continuous load up should be slower than normal and high step load should be prohibited.

Continuous load-up

The continuous load up capacity at each fuel mode is referred in Figure 5.5

Figure 5.5 Engine load up capacity in ramp

Diesel mode

At warm condition, the 100 % load can be achieved in 2 min. by continuous ramping up at normal condition. At emergency condition, the load can be more quickly increased to 100 % in 30 sec.

Gas mode

At warm condition, the 100 % load can be achieved in 270 sec. by continuous ramping up at normal condition. For fast loading, the load can be more quickly increased to 100 % in 80 sec. It should be taken into account that load increase at gas mode need to be more careful. Emergency load up should be only possible when it's really needed. This fast load up shall cause mechanical stress on engine and shall not be repeated too often.

Step by step load-up

Considering the time and safety required for stabilizing the frequency due to sudden load up, it is recommended to load up from idle to full load by more than three steps in diesel mode and five steps in gas mode. Frequency deviation and recovery time when loading up by step is referred in Figure 5.6 and Figure 5.7. At gas mode, the amount of load step is decreased at high load due to the higher knock tendency at high load.

Figure 5.6 Step load acceptance at diesel mode

1. Max instant load step: 0 – 33 – 66 – 100
2. Max speed variation $\leq 10\%$ ¹⁾
3. Steady-state speed band $\leq 1.0\%$
4. Recovery time ≤ 5 sec
5. Time between next load step ≥ 10 sec

Figure 5.7 Step load acceptance at gas mode

1. Max instant load step: 0 – 35 – 55 – 75 – 90 – 100
2. Max speed variation $\leq 10\%$ ¹⁾
3. Steady-state speed band $\leq 1.5\%$
4. Recovery time ≤ 5 sec
5. Time between next load step ≥ 15 sec

¹⁾ If a step load equivalent to the rated output of the generator is switched off, a transient speed variation exceeding 10% may be acceptable, provided this does not cause the intervention of the overspeed device

5.1.7 Fuel mode changeover

HiMSEN dual fuel engine operation at diesel or gas mode is possible when predefined condition for each mode is satisfied.

Fuel mode changeover is available from

- ✓ Switch in local (Engine room)
- ✓ Switch in remote (Engine control room)

When predefined trip condition at each fuel mode is detected, fuel mode is automatically transferred to safer fuel mode (gas to diesel, diesel to backup) for continuous operation without engine shutdown (Refer to Figure 5.1).

Changeover from gas to diesel (backup) fuel mode

The changeover from gas to diesel mode is available throughout the entire load range (0~100%) and is triggered either by the operator's request or automatically upon the occurrence of Gas trip or Pilot trip. When the changeover from gas to diesel mode is triggered, the applied fuel mode changes one of the following values:

- ✓ Diesel mode
- ✓ Backup mode (If Pilot trip is triggered)

Once the fuel changeover request is released, the fuel oil actuator is moved to the predefined position based on the current engine load, and gas fuel supply is cut-off immediately. The fuel mode transfer is performed in a second and as soon as the fuel oil actuator takes over the engine load, the PID controller for diesel fuel oil is activated.

Changeover from diesel to gas fuel mode

For changeover from diesel to gas, the following conditions have to be fulfilled:

- ✓ Applied Fuel Mode = gas mode
- ✓ Active Fuel Mode = diesel mode with MGO/MDO fuel¹⁾
- ✓ Engine load: Below 80% of the rated load

1) In order to changeover heavy fuel oil to gas operation, marine diesel oil/ marine gas oil flushing operation is required.

When fuel changeover request is released, gas leakage test is performed. Upon successful completion, the gas pressure is ramped up to the setpoint determined by the engine load. And the second shut-off valve of the GRU is opened, allowing gas to flow toward the engine. Any air accumulated in the gas piping during diesel mode is rapidly purged via SV88 degassing valve and fuel gas is filled quickly. Once this preparation sequence is successfully complete, fuel gas is injected into combustion chamber, with the injection duration is ramped up from its base level. Simultaneously the fuel oil actuator is decreased as PID controller for diesel fuel is still active. When gas injection duration reaches predefined level, the primary fuel for PID control switches from diesel to gas, and the fuel oil actuator ramps down further. Finally the fuel oil actuator reaches the cut-off threshold, it moves to zero position, and the engine operates in fully gas mode. This stable transfer process may take several minutes to complete.

Figure 5.8 Fuel mode changeover from gas to diesel

Figure 5.9 Fuel mode changeover from diesel to gas

5.1.8 Engine stop

The engine stop is categorized into Normal stop, Shutdown, and Emergency stop. The engine can be stopped regardless of the active fuel mode. If the engine is stopped while in Gas mode, an additional ventilation sequence is automatically performed to remove residual gas in the exhaust system.

Normal stop

Normal stop sequence is performed when a stop command is activated while the generator circuit breaker (GCB) is open. Consequently, the de-loading and GCB opening must be carried out by an external system (PMS) prior to the stop command. Once the stop command is triggered, the engine may operate at a cool-down speed for a specified duration to dissipate residual heat (optional). If the stop is triggered in Gas mode, the gas shut-off and venting valves at the gas regulating unit are activated. And the engine's gas circuit is purged with inert gas. Following a stop from Gas mode, the exhaust system must be ventilated by the external gas ventilation unit for a predefined period, engine starting is interlocked until this ventilation sequence is complete. During the stopping sequence, the main fuel injection is reduced to zero immediately, while the pilot injection system remains active until the engine reaches a predefined speed to prevent carbon deposits on the nozzle hole of the pilot fuel injectors.

Figure 5.10 Engine normal stop sequence

Shutdown

When the engine enters predefined shutdown condition due to certain abnormality or stop command is triggered at generator circuit breaker (GCB) closed condition, the engine is shutdown immediately regardless of fuel mode and GCB must be opened by an external system (PMS) automatically without the de-loading.

If the engine is shutdown at gas mode operation, the shut-off valves and venting valves in gas regulating unit are activated and gas supply pipe on engine is purged with inert gas.

The pilot injection system is active until predefined speed to burn the residual gas in combustion chamber. After the engine stop from gas mode, the exhaust system must be ventilated by external exhaust gas ventilation unit during predefined time to prevent unexpected explosion of unburned gas. And before completion of this sequence, the engine start is blocked.

If the engine is shutdown at diesel mode operation, solenoid valve for stop air cylinder is activated so that it forces the fuel oil actuator to move zero position.

At both shutdown phases from gas and diesel mode, the pilot injection system is activated except the cases that overspeed and/or malfunction of both speed pick up sensors. In this case, the pilot injection system is deactivated at once.

Figure 5.11 Shutdown sequence

Emergency stop

Emergency stop is performed immediately under the following conditions:

- Pushing emergency stop buttons on the LOP/ACP
- Triggering a signal via an external system (e.g., VCS, IAS, ESDS)
- Critical safety limits are exceeded (e.g., Engine overspeed, High oil mist in the crankcase)

Under above conditions, the engine must be stopped instantly to ensure safety. The emergency stop procedure follows a sequence similar to Shutdown, with the primary exception that the pilot injection system is deactivated simultaneously with the main fuel injection.

Figure 5.12 Emergency stop sequence

Exhaust gas ventilation

Exhaust gas ventilation sequence is performed following an engine stop or shutdown from gas mode operation to purge residual gas from the exhaust gas piping. The ventilation process is performed once the engine has reached a complete standstill.

5.1.9 Engine safety

The HiMSEN dual fuel engine control system monitors the signals from all sensors on engine and takes an appropriate action against abnormality of engine for safe operation. All engine reaction including limit value and delay defined in HiMSEN dual fuel engine control system.

HiMSEN dual fuel engine control system fulfills and satisfies redundant and independent safety function against critical shutdown conditions. HiMSEN dual fuel engine control system implements safety functions written in next Figure 5.10 describes layout of HiMSEN dual fuel engine safety system.

Alarm

Engine control system releases alarm message against abnormal sensor signal or sensor failure. No influence to engine operation but the operator has to monitor the value carefully.

Start block

Engine control system releases alarm message and engine start is blocked. The start block condition has to be cleared before start the engine.

Load reduction

Engine control system releases an alarm message and requests a load reduction to 60% of the rated load or below to the external system such as the PMS, IAS and VCS. This request is transmitted through the digital signal of 'DO-012 Load reduction request'. Upon the activation of Load reduction alarm, 'DO-012 Load reduction request' is activated only if the current engine load exceeds 60% of the rated load (MCR) to request the external system to decrease the engine load. Once activated, 'DO-012 Load reduction request' remains pending until Load reduction alarm is reset. To prevent a potential blackout, Engine control system will not reduce the engine load by itself. Therefore, the external system must take countermeasure actions to decrease the load or stop the engine in accordance with the vessel's operational concept.

Gas trip

Engine control system releases alarm message and the fuel mode is transferred from gas to diesel mode and blocks gas mode operation while an engine is in diesel mode operation. The gas trip condition has to be cleared before go back to gas fuel mode.

Pilot trip

Engine control system releases alarm message and the fuel mode is transferred from gas (diesel) to backup mode. The pilot trip condition has to be cleared before go back to gas fuel mode. If pilot trip is released, gas fuel mode is blocked due to former backup mode operation. And, Pilot FO injection system test (conventional or alternative) has to be performed in order to clear gas mode block.

Shutdown

Engine control system release shutdown message and the engine is shutdown after predefined delay. Pilot injection system is alive until injection-off speed to burn the rest of gas in combustion chamber.

Emergency stop

Engine control system release emergency stop message and the engine is shutdown immediately.

Figure 5.13 Engine control system safety function

5.2 Engine control system

5.2.1 General

The HiMSEN engine control system “HiMECS-AE” is designed for control and monitoring variant type of HiMSEN 4 stroke dual fuel engines

All hardware configuration of HiMECS-AE consists of LOP (Local Operating Panel), IOS_M (IO station main), IOS_1 (IO station 1), ICM (Injection Control Module), CMM (Cylinder Monitoring Module) and ACP (Auxiliary Control Panel). This hardware configuration can be expanded to integrate optional components. The internal communication can be expanded depending on system applications. In addition, the external communication is facilitated through the Managed ethernet switch to external systems, which provides controlled and secure connectivity to external systems.

HiMECS-AE is responsible for operation, full monitoring of engine and safety function. All sensors and actuators are connected and dedicated actions are taken for more optimized and safe operation condition.

Figure 5.14 HiMSEN DF Engine Control System overview

5.2.2 Hardware description

Figure 5.15 Arrangement of HiMECS-AE for H35DF

Local Operating Panel (LOP)

LOP integrates three primary components:

- Main Control Unit (MCU): Serves as the central processor module for overall engine control.
- Engine Safety Unit (ESU): Provides an independent engine shutdown system, physically and functionally separate from the Main Control Unit.
- Display Unit: Provides the operator a comprehensive interface for engine operation and monitoring.

Figure 5.16 Layout of Local Operating Panel

Button indication:

- ⑥ Diesel/Gas mode selection switch
- ⑦ Emergency stop push button
- ⑧ Gas trip request push button

Components:

- ⑨ Fan-and-Filter
- ⑩ Outlet filter
- ⑪ Wire damper

IO Station Main (IOS_M)

IOS_M is integrated with IOU_M (IO Unit Main) and sub-components. IOU_M consists of Communication unit and IO modules that interfaces with engine IOs. This unit processes signal data acquisition from connected instruments and manages data transfer to MCU via Ethernet line.

Figure 5.17 Layout of IO Station Main

Components:

- ① Fan-and-Filter
- ② Outlet filter
- ③ Wire damper

IO Station 1 (IOS_1)

IO Station 1 is integrated with IOU_1 (IO Unit 1) and sub-components. IOU_1 consists of Communication unit and IO modules that interfaces with engine IOs. This unit processes signal data acquisition from connected instruments and manages data transfer to MCU via Ethernet line.

Depending on the structure of engine and turbochargers (TC), additional I/O stations (such as IOS_2, IOS_3, ..., IOS_N) can be applied. This modular design allows the system to expand its I/O capacity to meet specific project requirements.

Figure 5.18 Layout of IO Station 1

Components:

- ① Wire damper

Injection Control Module (ICM)

ICM is mounted on the engine and connected to the GAV (Gas Admission Valve) and PFI (Pilot Fuel Injector) of each cylinder for HiMSEN Dual fuel engine.

ICM is responsible for processing a part of engine I/O signals and interfaces with MCU (Main

Control Unit) via the CAN bus.

When knock sensors are installed, those sensors are connected to ICM, which calculates knock intensity and transmits the processed information to MCU for anti-knock control.

Figure 5.19 Injection Control Module

Cylinder Monitoring Module (CMM)

To achieve higher thermal efficiency and ensure stable engine operation, it is essential to control the combustion process of individual cylinders. For this reason, CMM is integrated into the Engine Control System. CMM monitors both the combustion characteristics and knock intensity of each cylinder, providing key information such as Knock level, IMEP, Pmax, SoC, CoC, EoC, and Heat release... in real-time to the MCU. This data is transmitted to MCU via CAN bus to support anti-knock control, stable cylinder balancing control, and comprehensive combustion status monitoring.

Figure 5.20 Cylinder Monitoring Module

Auxiliary Control Panel (ACP)

ACP is installed in engine control room as self-standing cabinet. It is responsible for interfacing not only with the engine auxiliary equipment but also with external systems such as IAS, MSB and PMS.

5.2.3 Functional description

Speed control

The Engine Control System (ECS) regulates engine speed under all load conditions, responding to load demands set by external systems. In Diesel Fuel Mode, ECS regulates the fuel oil actuator to adjust fuel injection quantities. In Gas Fuel Mode, ECS regulates the duration of gas admission valve for speed control.

Speed measurement

HiMECS-AE features a comprehensive redundant and independent speed measurement configuration to ensure operational reliability. For engine speed control, two pickup sensors on flywheel are connected to IOS_M, which transfers signals to MCU via communication. This redundancy allows for continuous engine operation even in the event of a single sensor failure. For independent safety monitoring, a dedicated pickup sensor on flywheel is connected to engine safety unit (ESU) to detect overspeed and triggering shutdown.

Additionally, two pickup sensors mounted on camshaft gear to provide ICM with precise timing defined as °CA (Crank Angle) before TDC. The secondary pickup is linked to CMM via an optocoupler for combustion performance analysis.

Figure 5.22 Speed measurement configuration

Speed adjustment

In local mode, engine speed is adjusted manually by the switches for speed/load increase and decrease on the LOP (in local mode).

In remote mode, speed is adjusted remotely by two digital contact signal 'Remote +speed/load' and 'Remote -speed/load'.

At any control mode, the speed is adjusted automatically by external system during synchronization.

Table 5.2 Speed adjustment in local and remote mode

Control mode	Local mode		Remote mode	
Status	Speed adjustment in Local	Speed adjustment in Remote	Speed adjustment in Local	Speed adjustment in Remote
Rated speed (Unsynch. or synchronization)	O	O	X	O
Load-run at Droop mode	O	X	X	O

Air Fuel ratio control

The AFR (Air-Fuel Ratio) is controlled by adjusting the opening ratio of wastegate valve. This valve regulates the volume of exhaust gas bypassing the turbocharger. The operating point is defined by charged air pressure corresponding to each specific load point.

Pilot fuel injection control

In HiMSEN DF engine, pilot injection is ignition source of combustion. Pilot fuel injection system is common rail electronic fuel injection system. ECS should control pilot fuel injection timing and duration of electronic pilot fuel injector and pilot fuel injection pressure of HP pump.

Fuel gas pressure and valve control

The engine control system (ECS) performs precise gas pressure regulation by controlling the I/P-converter in the GRU. It manages sequential operation of gas valves installed on the GRU and engine, as well as the actuation of gas admission valves.

Knocking and cylinder balancing control

Cylinder combustion pressure and knock monitoring function is integrated in HiMECS-AE and this concept guarantees sophisticated anti-knocking and cylinder combustion balancing control.

Figure 5.23 Overview of HiMSEN DF engine control function

5.3 Outline of engine automation

5.3.1 General

HiMSEN DF ECS is closely interfaced with external system and provide full capability for optimum operation at different fuel mode.

The external system should also recognize the current fuel mode and take a proper action based on fuel mode.

Refer to Fig. 5.24 for system schematic of the external interface.

This information is only for reference with single engine diagram.

The external interface can be different and depending on the project.

Figure 5.24 HiMSEN DF ECS external interface (system schematic)

5.3.2 Communication diagram

HiMECS-AE communication is divided into three networks. Serial link, CANbus, and Ethernet. For serial communication, ESU (Engine Safety Unit) is directly connected to MCU (Main Control Unit) via a serial link using RS485 protocol. Display unit (HMI: Human machine user interface) is connected to MCU via serial communication RS232.

For CAN communication, MCU and ICM (Injection Control Module) are interconnected through a redundant dual CANbus network. The communication between MCU and CMM (Cylinder Monitoring Module) is implemented as a single CANbus network.

The Ethernet communication architecture of HiMECS-AE is structured into two distinct domains, internal communication and external communication. With Managed Ethernet Switch installed in ACP, HiMECS-AE can provide the segregation between the internal and external network, ensuring that the internal network remains isolated from unauthorized access.

The communication diagram of HiMECS-AE consists of internal communication between LOP, IOS_M, IOS_1, and ACP, as well as external communication using the Managed Ethernet Switch.

External communication is restricted to authorized external systems through designated ports on the Managed Ethernet switch and to access through VLAN (Virtual LAN) functionality, ensuring secure and segmented communication.

HiMECS-AE can provide comprehensive operational data including the engine status, real-time monitored values, and generated alarm information to the external system via Modbus TCP interface. As the Modbus protocol operates on the standard client/server architecture, HiMECS-AE is designated as the 'Server', while the external systems act as 'Client'. In this configuration, HiMECS-AE processes and responds to data queries initiated by the external system.

Figure 5.25 Communication diagram for HiMECS-AE

5.3.3 Power distribution diagram

HiMECS-AE is designed with a redundant power architecture to ensure high availability and continuous engine operation against a single power failure. The Power Supply Unit features an integrated UPS (Uninterruptible power supply) and battery system, which provides up to 30 minutes of backup mode operation in the event of a vessel blackout. This unit receives two electrically isolated 220VAC redundant circuits from shipyard's power distribution systems and converts them into a stable 24VDC supply for HiMECS-AE. This power is then integrated and distributed through ACP (Aux. control panel) to the engine-side components, including LOP, CMM and IO stations. Additionally, ICM (Injection control module) is supplied via a separate circuit to ensure a dedicated and stable power source, further enhancing overall system reliability.

Figure 5.26 Power distribution diagram for HiMECS-AE

5.4 Operation data and alarm points

Operation data of the engine is listed below.

Some data may be subject to change and shall be informed separately for specific project.

Table 5.3 Operation data of the engine

	Descriptions	Normal operation range at rated power		Alarm and sensor		Auto stop of engine	
Speed control	Engine speed	SE47	720 rpm 750 rpm 900 rpm 1000 rpm	GT High	10 % speed deviation	SD High	113% (1 st) 115% (2 nd)

MHI	MET30SRC	0.6 ~ 1.5	0.6	60 ~ 95	105
	MET37SRC	0.6 ~ 1.5	0.6	60 ~ 95	105
Napier	Na - series	1.5 ~ 2.5	1.3	60 ~ 95	115

1. Note. This value was selected after review by the engine builder based on the turbocharger maker manual.

5.5 Local instrumentations

Table 5.6 The symbol number and measuring range for local instrument

	Description	Symbol No.	Measuring range
Pressure	Fuel oil pressure at engine inlet	PI 51	0 ~ 16 bar
	Gas supply pressure at filter outlet	PI 81	0 ~ 10 bar
	Gas supply pressure at regulator outlet	PI 82	0 ~ 10 bar
	Compressed pressure at engine inlet	PI 41	0 ~ 40 bar
Temperature	Fuel oil temperature at engine inlet	TI 51	0 ~ 200 °C
	Low temperature water temperature at air cooler inlet	TI 71	0 ~ 120 °C
	Low temperature water temperature at air cooler outlet	TI 72	0 ~ 120 °C
	Gas supply temperature	TI 82	0 ~ 50 °C

1. All measurement can be monitored on local operating panel.

5.6 Hyundai intelligent Equipment Management Solution (HiEMS)

Introduction

HiEMS, offers a real-time engine status monitoring, troubleshooting guidance to marine engineers and provides connectivity between engines and on shore monitoring center.

With HiEMS, HiMSEN customers can get our experts of engine and service close to you.

With intuitive UI, engine operators can figure out the root cause of a certain alarm and get the technical advice and troubleshooting guide. When detecting the abnormalities in engine, HiEMS transfers alarm/fault information and sensor data to onshore for the detail analysis.

Also, HiEMS keeps long term data for fleet and engine managements.

Benefits

On Ship

HiEMS provides guidance for the engine operator, maintenance function with engineering based instruction guide and integrated trouble shooting guide, which enables engine operators to run and maintain HiMSEN Engine at optimal condition.

On Shore

Ship managers can manage the fleet of HiMSEN engines with HiEMS, accessible 24*7 through the Digital Innovation (DI) center of HD Hyundai Marine Solution (HMS).

Ship managers can get real-time remote diagnostics, qualified advices and services from our engineers and service experts (On reporting service version).

Main features

On Ship

Real-time status monitoring of the HiMSEN engine

- ✓ Status of the engine, indicator of sub systems, trend and surveillance with FAT.

Analysis tools for engine data

- ✓ Performance, deviation, correlation analysis and statistics.

Maintenance and guidance based on the instruction guide

- ✓ Alarm manager, maintenance manager, wearing parts manager.

On Shore

Status monitoring of the fleet of HiMSEN engines

- ✓ Overall status of alarm and running hour.
- ✓ Long term data management and reporting service.

License policy

Standard version

All main features for “On ship” is available, data of a specific time interval is sent to on shore, such as alarm, statistics and operational data.

Reporting service version

Including “Standard version” features, regular reporting service is available through HD Hyundai Marine Solution (HMS).

Contact HD Hyundai Marine Solution (HMS) for reporting service.

Figure 5.27 HiEMS configuration and network

Key functions

Real-time status monitoring of the HiMSEN engine

- ✓ Indicators of sub systems, running information.
- ✓ Status information by location through P&ID (DF only).

6 Fuel system

6.1 Modes of engine operation

Engine operation mode

Dual fuel engine can be operated by using the diesel oil or natural gas as main fuel. The operating mode can be changed without any interruption while engine is running. The fuel mode for the engine can be chosen by operator depending on the condition of vessel or plant. Also if there are any abnormal conditions in gas mode, the engine is automatically transferred to diesel mode without power de-rating. The engine operating modes are as follows :

- ✓ Gas mode : Natural gas + pilot oil
- ✓ Diesel mode : Main fuel oil + pilot oil
- ✓ Backup mode : Main fuel oil

Gas mode

In gas mode, the natural gas as main fuel is injected to the intake ports of each cylinder through the gas admission valve. The fuel gas is ignited by the micro pilot oil which is injected by pilot injector to the main combustion chamber.

The gas admission valve and pilot injector are operated by solenoid and electric controlled. The injection timing, the amounts of the fuel gas and / or pilot oil shall be adjusted at each cylinder by the engine control system.

Diesel mode

In diesel mode, it is same as the conventional diesel engine operation, i.e. heavy fuel oil or marine diesel oil can be used as the main fuel. When the charge air is compressed in the combustion chamber, the liquid oil is injected through the main injector which is controlled mechanically.

The micro pilot oil system is activated same as gas operating mode to keep the injector nozzles clean and ready for gas operating mode.

Backup mode

Backup mode is for the safety operation. When the engine control system, safety system or blackout detection system are activated, the engine is transferred to backup mode.

In backup mode, the engine is operated by just the main fuel while the micro pilot oil system is not operated. Please refer to the 5.1.2 regarding the operating time of the backup mode.

6.2 Internal fuel oil system

Diagram for Internal fuel oil system

*) Supply scope and instrument will be determined by EOD(Extent of Delivery) and engine builder's standard.

6.2.1 General description

Fuel system for the dual fuel engine is designed for a reliable combustion of heavy fuel oil or marine diesel oil as well as the natural gas. Therefore, it is possible to change over the fuel mode between HFO, MDO and natural gas without loss of the rated output.

The micro pilot oil system is designed as ignition source in gas operation. But it is also active in diesel to prevent the clogging of the pilot injector.

Fuel oil system

The fuel injection equipment comprises an injection pump, connection block, injection pipe and injection valve, which are installed on each cylinder. The system is designed for operating the high pressure of the fuel injection with better combustion.

The amount of fuel injection is controlled by the engine control system via the common regulating shaft and spring loaded linkage.

The control system can maintain the engine speed at the preset-value by continuous positioning of the fuel injection pump rack.

The clean fuel oil from each injection pump, high pressure connection block, etc. is drained for their normal operation and collected to the recycling fuel oil leakage alarm tank. The estimated drain amount of recyclable fuel oil is like follows;

- Estimated fuel oil drain amount [liter/hr per a cylinder]
 - For heavy fuel oil : 0.3 (50% tolerance) at 12 cSt
 - For distillate fuel oil : 1.2 (50% tolerance) at 2 cSt

The recycling fuel oil can be led to external tank to be reused and this value is only for reference to design this external system for its recycle. It can be recycled without additional separation process. Recycling fuel oil leakage alarm tank is a modularized box for the external connections, which provides :

- ✓ Connections for fuel oil return pipes 25 A
- ✓ Connection for a recycling drain pipe 15 A
- ✓ Alarm switch and tank for excessive leakage

The dirty leak oil is collected to the common drain pipe led to the sludge tank.

6.2.2 Micro pilot oil system

The micro pilot oil system comprises the pilot fuel pump, duplex filter and micro pilot injector on each cylinder. It is applied with the common rail system which is able to control the injection of the small amount of pilot oil with suitable timing and duration.

At the pilot fuel pump, the pilot oil is pressurized up to 1000 bar and conveyed to each injector via the high pressure pipes which are made of the double walled structure for safety. The return pilot oil from injectors and the pilot fuel pump is collected to common return pipes and can be recycled. For the return quantities of pilot oil, see 'Table 6.3 return quantities of pilot oil'.

Table 6.3 return quantities of pilot oil

Engine type	Return of pilot oil (liter/hour)
6H27DF	27.89
7H27DF	29.53
8H27DF	31.18
9H27DF	32.83

^{*)} Including tolerance $\pm 50\%$

The leak rate of the micro pilot oil system is normally zero. Any leak from high pressure pipes, it is drained via the intermediate space of double walled pipes or the safety valve of the distribute block and collected to the recycling fuel oil alarm tank for clean oil. The clean leak oil is led to recycling fuel oil drain and can be reused.

For the micro pilot oil system, only marine diesel oil (DMA, DMB, DMZ) can be used.

6.3 External fuel oil system

3. This external fuel oil system is only for guidance for generator engines. All external piping design and system arrangement should be designed by shipbuilder in accordance to the classification rules and building specifications

6.3.1 General requirements

The external fuel system for the auxiliary engines can be a common system with main engine or an independent system depending on the shipbuilder's choice.

In any cases, the condition of fuel oil, especially heavy fuel oil, is critical for the reliable operation of the engine. The most important conditions and requirements of the external fuel oil system are described as follows :

Well cleaned fuel

Solid particles and water in the fuel cause over wearing and frequent maintenance for the engine itself as well as external fuel system. Therefore, the proper and reliable separation equipment should be included in the external fuel oil system not only for heavy fuel oil but also for distillate fuel.

Proper viscosity, temperature, pressure

The appropriate viscosity, temperature and pressure are necessary. Therefore, preheating, insulation with heat tracing, and pressurizing equipment should be included in the external fuel oil system. Especially if the fuel is at low viscosity, fuel temperature should be controlled to meet the required viscosity by fuel cooling device such as cooler unit.

In order to prevent excessive pressure losses and also to minimize possible pressure pulses in the piping system, the fuel oil velocity should not exceed :

- ✓ Marine diesel oil suction pipe : 0.5 ~ 1.0 m/s
- ✓ Marine diesel oil pressure pipe : 1.5 ~ 2.0 m/s
- ✓ Heavy fuel oil suction pipe : 0.3 ~ 0.8 m/s
- ✓ Heavy fuel oil pressure pipe : 0.5 ~ 1.2 m/s

Marine diesel fuel oil

Diesel fuel oil system is necessary to back up (especially for emergency situations) and, it is also used for flushing before engine stop for long period standstill and in the event of major overhaul.

External fuel oil system

Normally comprises the fuel treatment system and fuel feed system. General requirements described on next section and more detailed information can be provided if needed for specific vessel or plant.

Fuel oil treatment system

The fuel treatment system should be designed for proper cleaning of heavy fuel oil considering total fuel consumption of the vessel. Centrifugal separators should be an automatic type with the same additional stand-by unit. The separator should be capable of purifying the worst grade of the fuel oil. Normally, the fuel oil grade of H380 to H700 requires the capability of up to 1010 kg/m³.

For distillate fuel, an independent purifier system is required.

It is necessary to ensure a proper cleaning of heavy fuel oil as follows :

- ✓ Selection and operation of fuel oil centrifuge according to supplier's recommendation
- ✓ Correct heavy fuel oil temperature at inlet to centrifuge
(The centrifuge should be always operated with an inlet temperature of 98 °C for heavy fuel oil)
- ✓ Correct throughput of fuel oil through centrifuge

$$Q = \frac{P \times b \times 24(h)}{p \times t}$$

P = maximum continuous output of the engine(s) [kW]

b = specific fuel consumption + safety margin (15 %) [g/kWh]

p = density of the fuel [kg/m³]

t = daily separating time(h) (usually = 23 h or 23.5 h)

- ✓ Proper density of heavy fuel oil in conformance with centrifuge specification
- ✓ Proper maintenance of centrifuge

The centrifuges should be operated in parallel, unless the centrifuge installation comprises manually operated centrifuges, with the purifier followed by the clarifier. To achieve the maximum separation efficiency, it is recommended to always use all available heavy fuel oil centrifuges whenever possible, and to operate them in parallel with an adjusted feed rate lowering the throughput in the centrifuges. This will ensure the longest possible retention time in the centrifuges and optimal efficiency for removal of catalytic fines.

It is important that maintenance and operation of the centrifuge is done according to the recommendations of the manufacturer.

The required capacity of the daily (service) tank and the settling tank for heavy fuel oil is minimum 24 operating hours feed for continuous full load operation. Each tank should be heated to have stable temperature between 50 ~ 70 °C. Each tank should be equipped with effective sludge and water drain system.

6.3.2 Fuel feed system

The fuel feed system can be common with other engines. The one of the most important is the proper control of the fuel viscosity. So the fuel feed system should have appropriated heating equipment and insulation accordingly. In addition, the fuel oil should be pressurized to avoid the gas separation due to high temperature.

Day tank for heavy fuel oil and marine diesel oil (TK-01 / 02)

The heavy fuel day tank should be filled with cleaned fuel by continuous fuel separation.

- ✓ Tank capacity : minimum 24 operating hours feed for full load operation.
- ✓ Tank heating : approx. 75 °C as stable as possible.
- ✓ Sludge / water space and drain provided.

Heavy fuel oil / marine diesel oil changeover valve (CV-01 / 02)

The heavy fuel oil / marine diesel oil changeover valves should be installed before the supply pump and the cooler for fuel oil outlet respectively. The valve can be a manual type or an electro-pneumatic remote control type for the flexible fuel mode selection at any load conditions.

Suction strainer (FT-01)

To protect the supply pump, a suction strainer with a fineness of approx. 0.5 mm with magnet should be installed on the pump suction side.

Supply pump (PP-01)

- ✓ Capacity : min. 1.5 x total fuel consumption at maximum continuous rating + back flushing quantity
- ✓ Pump head : 4 bar (HFO)
- ✓ Operating temperature : 100 °C
- ✓ Viscosity (for electric motor) : 1000 cSt

Flow meter (FM-01)

If a measuring device for fuel oil consumption is required, it has to be fitted between the supply pump and the mixing tank.

A by-pass line has to be installed in parallel with the flow meter to ensure the fuel oil supply free from possible clogging.

Mixing tank (TK-03)

The major purpose of mixing tank is to ensure the ventilation of the gas from the hot fuel oil and a gradual temperature balance by mixing the hot returned oil from the engine with the oil from the day tank.

The volume of mixing tank is required not less than 100 liters.

Pressure control valve (PV-01 / 03)

The pressure control valves maintain constant system pressure. The surplus oil return to the supply pump suction side or to the fuel oil return line.

Booster pump (PP-02)

Since the heated fuel oil has to be continuously recirculated, the booster pump should ensure the fuel circulation with the required pressure in the system.

- ✓ Capacity : min. 3.0 x total fuel consumption at maximum continuous rating + back flushing quantity
- ✓ Pump head : 8 bar at fuel oil inlet
- ✓ Operating temperature : 150 °C
- ✓ Viscosity (for electric motor) : 500 cSt

Heater and viscosity controller (HE-01 / VC-01)

In order to ensure the correct injection viscosity at 12 ~ 18 cSt (HFO), the dual heaters are controlled by the viscosity controller.

Each heater should have sufficient capacity for heating the fuel oil for all engines at full load, one heater can therefore be overhauled while the other one is in service.

Auto back flushing filter (FT-03)

In the circulating lines, absolute 10 µm automatic back-flushing filter must be installed before the branch pipe for each engine to ensure the cleanness of the fuel oil. If the cleaning cycles of the automatic back-flushing filter are increased, the fuel oil treatment system must be optimized in order to protect the engine. If a stand-by filter is equipped, the absolute 25 µm is required. The location of installing filter is acceptable in the supply lines.

Drain tank for dirty oil (TK-04)

The dirty leak oil from the engine is drained by gravity and collected to the drain tank for dirty oil, where heating coils are required. The drain tank should be transferred to the sludge tank.

Drain tank for clean oil (TK-05)

The clean leak oil from the engine is drained by gravity and collected to the drain tank for clean oil, in where heating coils are required. It can be pumped to the day tank and reused to the engine without additional separation process.

Marine diesel oil cooling system (HE-02)

The marine diesel oil cooler or alternative should be applied on the fuel oil return line of engines in order to maintain suitable viscosity of marine diesel oil in continuous marine diesel oil operation.

When changeover from heavy fuel oil to marine diesel oil, the fuel oil return passes through the marine diesel oil cooler or alternative by changeover valve operation.

Emergency start

In emergency situation such as black out, marine diesel oil must be supplied to start up stand-by engines with a sufficient fuel oil pressure, which can be supplied by emergency booster pump or a gravity tank which is located minimum 8 m above the engine.

6.3.3 Pilot fuel oil supply system

Pilot fuel oil is supplied from marine diesel oil / marine gas oil day tank via the feed pump and filter, which system can be common with other engines. The pilot fuel oil supply pressure should be constant and heavy fuel oil is not allowed to enter the pilot oil system.

The pilot oil return from the engine can be led to marine diesel oil / marine gas oil day tank directly.

The back pressure in the return line is allowed maximum 2.0 bar to ensure function and reliability of the pilot oil system on the engine.

Suction strainer (FT-02)

To protect the pilot fuel oil supply pump, a suction strainer with a fineness of approx. 0.5 mm with magnet should be installed on the pump suction side.

Pilot fuel oil supply pump (PP-03)

- ✓ Capacity : min. 0.3 m³ / hour
- ✓ Pump head : 5 ± 1 bar at pilot oil inlet, F9
- ✓ Operating temperature : 40 °C
- ✓ Viscosity (For electric motor) : 1.8 ~ 11 cSt

Fine filter (FT-04)

We recommend the installation of the fine filter before the engine on the pilot oil supply system, which is a duplex type with filtration of 34 μm absolute and equipped with differential pressure indicator. The filter should be placed as close to the engine as possible.

Pressure control valve (PV-02)

The pressure control valve is required for the constant supply pressure at the pilot fuel oil supply line with bypassing to the marine diesel oil / marine gas oil day tank.

The pressure control valve should be controlled to set the target pressure 5 bar of pilot oil to engine.

The bypassing pilot oil after pressure control valve (PV-06) should not be connected to the returned pilot line.

6.3.4 Pilot fuel oil cooling system

If the viscosity of marine diesel oil / marine gas oil in day tanks drops under the minimum value of recommended viscosity ranges for pilot fuel oil system, it is required to install a pilot fuel oil cooler on the engine supply line for reliable viscosity of fuel oil.

The pilot fuel oil cooling system should maintain the temperature of marine diesel oil low than 50 °C at engine inlet. For very light sulfur fuel oil, the temperature should be adjusted in accordance to the fuel oil specification.

The cooler should be installed at the return line after the engine(s) and composed with the bypass pipe and manual valve to ensure fuel oil circulation while the cooler is overhauled. The minimum required capacity of pilot fuel oil cooler can be estimated as following formula:

$$P=Q \times \rho \times c \times dT$$

P (kcal/h) = required capacity of the cooler

Q (m³/h) = maximum delivery quantity of fuel oil
(Equal to the flow capacity of pilot fuel oil supply pump)

ρ (kg/m³) = fuel oil density at 15 °C (Typical value: 900 kg/m³)

c (kcal/kg°C) = specific heat of fuel oil (Typical value: 0.478 kcal/kg°C)

dT (°C) = temperature difference between the fuel oil of marine diesel oil /marine gas oil day tank and the cooler outlet

1. The cooler outlet temperature should be obtained in order to meet the minimum value of the recommended viscosity range for pilot fuel oil system.
2. These parameters suggested typically are only for reference. When dimensioning pilot fuel oil cooler capacity, the parameters must be taken into account based on actual fuel oil properties.

6.4 Fuel oil specification

The fuel oil specifications are based on ISO 8217 : 2024(en). The fuel is largely classified into two categories as distillate fuel and residual fuel. Distillate fuel are categorized into DMX, DMA, DFA, DMZ, DFZ, DMB, and DFB. Residual fuels are categorized into RMA 10, RMB 30, RMD 80, RME 180, RMG 180 to 700, RMK 380 to 700. The usage of DMX is restricted by SOLAS requirement due to its low flash point.

ISO 8217:2024 also specifies the requirements for FAME-based bio-distillate and bio-residual fuels. HiMSEN engines are fully compatible with biofuels that satisfy the specifications set forth in both ISO 8217:2024 and Table 6.13.

The terminologies of marine fuel oil to be called after 1st January 2020 have been determined as below Table 6.6. In accordance with the most relevant characteristics.

HiMSEN is able to operate with all fuels specified in the below table. The simplified terminologies listed in Table 6.6 allows easy determination if the fuel can be applicable for HiMSEN.

Table 6.6 Designation of fuel grades

Fuel grade		Sulfur content (%)	Typical viscosity (cSt) (at 50 °C for residual fuels and 40 °C for distillate fuels)		ISO 8217 : 2024(en)
			Minimum	Maximum	
HFO (Heavy fuel oil)	HSFO (High sulfur fuel oil)	1.0 < S ≤ 3.5 (or even higher)	10	700	Residual marine fuels (RMB, RMD, RME, RMG, RMK)
	LSFO (Low sulfur fuel oil)	0.5 < S ≤ 1.0			
	VLSFO (Very low sulfur fuel oil)	0.1 < S ≤ 0.5	2 ~ 380 (Not decided yet)		Not defined
	ULSFO (Ultra low sulfur fuel oil)	S ≤ 0.1	9 ~ 67 (Not decided yet)		
MGO (Marine gas oil)		S ≤ 1.0	2	6	Distilled marine fuels (DMA, DFA, DMZ, DFZ)
MDO (Marine diesel oil)		S ≤ 1.5	2	11	Distillate marine fuels (DMB, DFB) Residual marine fuels (RMA 10)

- a) 1 mm²/s = 1 cSt.
- b) The buyer is expected to define the maximum sulfur content according to relevant statutory limitations.
- c) See Annex E.
- d) If the sample is not clear and bright, the existent total sediment and water tests shall be required. See 6.8 and 6.11.
- e) If the sample is not clear and bright, the test cannot be undertaken and therefore, compliance with this limit cannot be shown.
- f) See 5.1 and Annex A. De minimis level amount of FAME means an amount not exceeding approximately 0,5 %.
- g) The seller shall report the FAME content according to the test method given or as per blend ratio (stating whether it is a mass or volume ratio).
- h) The value shall be reported according to the test method given.
- i) Pour point cannot guarantee operability for all ships in all climates. The buyer should confirm that the cold flow characteristics (pour point, cloud point, cold filter plugging point) are suitable for the ship's design and intended voyage. See 6.10.
- j) For some products, it is possible that this test does not work due to appearance, therefore other means to evaluate usability of the product should be considered.
- k) If the sample is dyed and not transparent, then the water limit and test method as given in 6.11 shall apply.
- L) This requirement is applicable to fuels with a sulfur content below 500 mg/kg (0,050 % by mass).
- M) These categories are defined in ISO 8216-1.

Table 6.8 Residual marine fuels with sulfur content below or at 0,50 % by mass

Characteristics	Units	Limit	Category ISO-F ^j				Test method (reference)

Ash content by mass	%	max.	0,070	0,100		0,150	ISO 6245
Vanadium	mg/kg	max.	150	350		450	IP 501, IP 470 or ISO 14597; see 6.13
Sodium	mg/kg	max.	50	100			IP 501, IP 470; see 6.14
Aluminium plus silicon	mg/kg	max.	40	60			IP 501, IP 470 or ISO 10478; see 6.15
Unrefined used lubricating oil (ULO) present: Calcium and zinc or Calcium and phosphorus	mg/kg		Calcium > 30 and zinc > 15 or Calcium > 30 and phosphorus > 15				IP 501 or IP 470, IP 500; see 6.16
Potential total sediment content by mass (TSP)	%	max.	0,10 ^g				ISO 10307-2, Procedure A; see 6.8
Accelerated total sediment content by mass (TSA)	%		Report ^h				ISO 10307-2, Procedure B; see 6.8
Existent total sediment content by mass (TSE)	%		Report ^h				ISO 10307-1; see 6.8
Fatty acid methyl ester (FAME) content by mass or volume	%		i				ASTM D7963; see 6.9

- a) Actual viscosity to be reported to the ship. For fuels with high pour point, the viscosity can be calculated provided that the kinematic viscosities at two temperatures are known.
- b) 1 mm²/s = 1 cSt.
- c) For fuels with viscosity in the range of 2 mm²/s to 5 mm²/s (2 cSt to 5 cSt), the minimum viscosity requirement of the engine should be checked against the original equipment manufacturers' recommendations.
- d) The buyer is expected to define the maximum sulfur content according to relevant statutory limitations.
- e) See Annex E.
- f) The buyer should confirm that this pour point is suitable for the ship's intended area of operation.
- g) This limit applies to 10 g of test specimen only. Failure to complete filtration of 10 g within 25 min means the fuel does not meet the specification. In such case and for information only, 5 g filtration results can be reported according to the test method.
- h) The value shall be reported in accordance with the test method given.
- i) See 5.1 and Annex A. De minimis level amount of FAME means an amount not exceeding approximately 0,5 %.
- j) These categories are defined in ISO 8216-1.

Unrefined used lubricating oil (ULO) present: Calcium and zinc or Calcium and phosphorus	mg/kg		Calcium > 30 and zinc > 15 or Calcium > 30 and phosphorus > 15					IP 501 or IP 470, IP 500; see 6.16
Potential total sediment content by mass (TSP)	%	max.	0,10 ^g					ISO 10307-2 Procedure A; see 6.8
Accelerated total sediment content by mass (TSA)	%		Report ^h					ISO 10307-2 Procedure B; see 6.8
Existent total sediment content by mass (TSE)	%		Report ^h					ISO 10307-1; see 6.8
FAME content by mass	%		Report ⁱ					ASTM D7963 or IP 631; see 6.9
Net heat of combustion	MJ/kg		Report ^h					ASTM D240; see 6.18

- a) Actual viscosity to be reported to the ship. For fuels with high pour point, the viscosity can be calculated provided that the kinematic viscosities at two temperatures are known.
- b) $1 \text{ mm}^2/\text{s} = 1 \text{ cSt}$.
- c) For fuels with viscosity in the range of $2 \text{ mm}^2/\text{s}$ to $5 \text{ mm}^2/\text{s}$ (2 cSt to 5 cSt), the minimum viscosity requirement of the engine should be checked against the original equipment manufacturers' recommendations.
- d) The buyer is expected to define the maximum sulfur content according to relevant statutory limitations.
- e) See Annex E.
- f) The buyer should confirm that this pour point is suitable for the ship's intended area of operation.
- g) This limit applies to 10 g of test specimen only. Failure to complete filtration of 10 g within 25 min means the fuel does not meet the specification. In such case and for information only, 5 g filtration results can be reported according to the test method.
- h) The value shall be reported in accordance with the test method given.
- i) The seller shall report the FAME content in accordance with the test method given or as per blend ratio (stating whether it is a mass or volume ratio).
- j) These categories are defined in ISO 8216-1.

Table 6.10 Residual marine fuels with sulfur content above 0,50 % by mass

Characteristics	Unit	Limit	Category ISO-F-j					Test method (reference)
			RME	RMG	RMG	RMK	RMK

Aluminium plus silicon	mg/kg	max.	50	60			IP 501, IP 470 or ISO 10478; see 6.15	
Unrefined used lubricating oil (ULO) present: Calcium and zinc or Calcium and phosphorus	mg/kg		Calcium > 30 and zinc > 15 or Calcium > 30 and phosphorus > 15					IP 501 or IP 470, IP 500; see 6.16
Fatty acid methyl ester (FAME) content by mass or volume	%		i					ASTM D7963; see 6.9

- a) For fuels with high pour point, the viscosity can be calculated provided that the kinematic viscosities at two temperatures are known.
- b) 1 mm²/s = 1 cSt.
- c) Fuels with viscosity below 20,00 mm²/s (20,00 cSt) can be agreed between seller and buyer. It is recommended to check the minimum viscosity requirement with the original equipment manufacturer recommendations.
- d) See Annex C.
- e) The buyer is expected to define the maximum sulfur content according to relevant statutory limitations.
- f) See Annex E.
- g) This limit applies to 10 g of test specimen only. Failure to complete filtration of 10 g within 25 min means the fuel does not meet the specification. In such case and for information only, 5 g filtration results can be reported according to the test method.
- h) The buyer should confirm that this pour point is suitable for the ship's intended area of operation.
- i) See 5.1 and Annex A. De minimis level amount of FAME means an amount not exceeding approximately 0,5 %.
- j) These categories are defined in ISO 8216-1.

Biofuels

Biofuels are largely classified into 3 categories as transesterified biofuels(biodiesel), bio-blends and others. (Classify biofuels with or without International standard)

- ✓ Transesterified Biofuels (International standards EN 14214 or ASTM D 6751-19)
ex) Biodiesel (Fatty Acid Methyl Ester – FAME)
- ✓ HVO (Hydrotreated Vegetable Oil) (International standards EN 15940, Paraffinic Diesel Fuel from Hydrotreatment)
- ✓ Bio-blends (Mixture of Biofuels and Fossil fuels)
- ✓ Other biofuels
ex) Crude biofuels (Palm oils, Vegetable oil, Animal fat), Refined biofuels, etc.

HiMSEN is able to operate continuously with biofuels specified in the below Table 6.11 and Table 6.12

- ✓ When using biofuels included in quality standards Table 6.11 and Table 6.12, you need to get confirmation from HiMSEN.

Biodiesel / Fatty Acid Methyl Ester (FAME)

Biodiesel (FAME) is derived from Crude biofuels by using transesterification processes. It can be used alone or blended with petro-diesel in any proportions.

International standards EN 14214 or ASTM D 6751-19 are commonly used to specify the quality of biodiesel. (See the Table 6.11)

Table 6.11 Specifications of biodiesel(FAME)

a) The temperatures related to filterability have to be at least 10~15°C above the minimum fuel oil temperature (maximum temperature among cloud point, pour point, CFPP, and LTFT) in the whole fuel treatment process, even during engine stop unless flushing using pure diesel oil were performed before engine stop.

b) The information of storage and deterioration of Biodiesel regarding EN14214 should be discussed/checked by fuel oil supplier before biodiesel is applied to engine.

Hydrotreated Vegetable Oil (HVO)

The EN 15940:2016 + A1:2018 + AC:2019 standard covers hydrotreated paraffinic renewable diesel fuel and synthetic Fischer-Tropsch products GTL, BTL and Coal-to-Liquid (CTL).

Since HVO consists of paraffinic hydrocarbons, it cannot meet the requirements set by EN 14214:2013+ A2:2019, which is a standard developed and valid only for methyl ester chemistry type biodiesel, namely FAME. As a matter of fact, HVO meets EN 590, except the requirement for minimum density. International standards EN 15940 are commonly used to specify the quality of HVO. (See the Table 6.12)

Table 6.12 Specifications of HVO(EN15940)

a) The temperatures related to filterability have to be at least 10~15°C above the minimum fuel oil temperature (maximum temperature among cloud point, pour point, CFPP, and LTFT) in the whole fuel treatment process, even during engine stop unless flushing using pure diesel oil were performed before engine stop.

Bio-blends

Bio-blends are mixture of biofuels and fossil fuels.

The volume ratio of the biofuel in the bio-blends are referred to as follows.

- ✓ B##, BD## (## : the volume ratio of the biofuel in the bio-blends)
 ex) BD20 = Biodiesel 20% + Distillate marine fuels 80%
 (In the case of Biodiesel mixture, it is specially referred to as BD##)
 B20 = Biofuel 20% + Fossil fuel 80%
 (Except for Biodiesel mixture, the other bio-blends are referred to as B##)

The quality standards of biodiesel-blends(BD##) are referred to the Table 6.11 and the bio-blends(B##) except for biodiesel-blends(BD##) are referred to the Table 6.13.

General biofuels

The quality standards of general liquid biofuels except biodiesel(FAME) are as shown below Table 6.13.(General biofuels include a wide range of specifications. In order to reduce confusion when applying biofuel standards, HiMSEN set the integrated standard with the Table 6.13.)

Only biofuels that meet EN14214 or EN15940 can be applied to Micro-Pilot (MP) injector. The information of storage and deterioration of biofuels should be discussed/checked by fuel oil supplier before the biofuel is applied to engine.

Table 6.13 Specifications of general biofuel, bio-blends.

- b) It is required the agreement of FIP maker and HHI if the total acid number is more than 2.5 mg KOH/g.
- c) Aluminium and Silicon contents shall be less than 10 ppm at engine inlet although those contents is required less than 60 mg/kg in fuel oil.
- d) It is required the agreement of SCR maker if the project is required the SCR with engine.

6.5 Fuel oil viscosity diagram

The viscosity of heavy fuel oil to the engine should be kept within the value of 12 ~ 18 cSt. However, the viscosity varies depending on the properties and the temperature of the fuel oil. Maximum preheating temperature of heavy fuel oil is limited up to 155 °C to avoid the vaporization of the fuel oil. A typical fuel oil viscosity diagram with temperature is as follows :

1. The viscosity of marine diesel oil / marine gas oil to the engine should be kept within the value of 2 ~ 14 cSt in order to avoid possible sticking of fuel injection pump due to low lubricity of marine diesel oil / marine gas oil.

Figure 6.4 Diagram for fuel oil viscosity

6.6 Fuel oil quality

6.6.1 Fuel characteristics

Viscosity

The viscosity of fuel oil to the engine should be kept within the value of 12 ~ 18 cSt for heavy fuel oil and 3 ~ 14 cSt for marine diesel oil / marine gas oil, which could be achieved by proper heating recommended by fuel supplier as the viscosity varies depending on the properties of the fuel oil.

Density

If the density of the fuel oil is over the maximum density (991 kg/m³ at 15 °C), the fuel oil is hard to be used because it is highly expected to be contaminated by water or solid unfiltered from system. The special centrifuging system should be installed for the fuel oil with the maximum density (1010 kg/m³ at 15 °C).

Sulfur

It is important to keep proper sulfur contents in the fuel oil. The high sulfur content in the fuel may increase the risk of low temperature corrosion in the combustion chamber and contribute to the formation of high temperature deposit. It is also recommended to keep the proper alkalinity of the lubricating oil for neutralizing.

Ash

The ash content comes from natural crude oil and also from contamination during treatment of the fuel. The solid ingredients can be removed mostly by centrifuging of the fuel. However there are soluble compounds such as vanadium and sodium, which can be transformed as ash after combustion. As the ash in any form promotes mechanical wear of engine parts and harmful deposits in the combustion chamber, the ash components should be carefully analyzed and removed in advance.

Vanadium and sodium

Vanadium is oil – soluble and comes from crude oil mostly. However sodium is water-soluble and comes from crude oil as well as contaminated fuel by salt water. As vanadium and sodium become corrosive ash after combustion, these should be removed as possible. A sodium compound contributes to lower the melting point of vanadium ash, which is very corrosive and harmful to exhaust valves and turbocharger. Therefore, compounds should be less than 1/3 of vanadium contents in weight.

Conradson carbon

Including much conradson carbon may impair combustion properties of the fuel and cause deposit formation in combustion chamber and exhaust system particularly at low engine output.

Asphaltenes

High asphaltene contents shall contribute to forming of deposit in combustion chamber as well as exhaust system at low loads and stick the fuel injection pump. It also causes excessive centrifuge sludge and deposits in the fuel system.

Water

The water content can be measured by a standardized distillation test. The water causes corrosion and cavitation of the fuel system and fouling of the exhaust system and turbochargers. Therefore, water content at engine inlet should be controlled under the following limit according to fuel type.

- ✓ Residual fuel : Max. 0.2 mass %
- ✓ Distillate fuel : Max. 0.02 mass%

Abrasive particles

Fuel oil can be contaminated by abrasive particles composed of aluminium and silicon. If the efficient fuel treatment is not applied, these fine catalysts can cause abnormal wear on injection system and cylinder liners / piston rings. The aluminum and silicon should be reduced to maximum 15 mg/kg before engine inlet.

6.6.2 Ignition quality

The ignition quality is related to the ignition delay to the intervals between fuel injection and combustion. If the engine is operated at low load or in the condition of low temperature or pressure in the combustion chamber, the ignition delay is lengthened. During the initial operation, the engine can be damaged by the low ignition quality without sufficient preheating. The equation of CCAI (Calculated Carbon Aromaticity Index) developed by Shell can be used to get the ignition quality of the heavy fuel oil.

Calculated carbon aromaticity index

$$CCAI = D - 81 - 141 \times \log \times [\log \times (V_k + 0.85)]$$

Where :

D (kg / m³ at 15 °C) = Density

Vk (cSt at 50 °C) = Viscosity

If the value of CCAI is increased, the ignition quality has decreased value. The fuel oil with high CCAI value can cause a combustion problem.

To prevent any troubles about poor ignition quality, engine should be preheated sufficiently before start and has proper functions of cooling system and injection system.

From light distillates to residual fuels, net and gross specific energy can be tested or calculated according to various international standards. Basically, the specific energy value provided by fuel supplier is adapted for the determination of the heat of combustion.

If it is not supplied from fuel supplier, it can be calculated by the specification of other properties as the equations given below.

For residual fuels,

$$N = (46.704 - 8.802 \times \rho^2 \times 10^{-6} + 3.167 \times \rho \times 10^{-3}) \times [1 - 0.01 \times (w + a + s)] + 0.0942 \times s - 0.02449 \times w$$

$$G = (52.190 - 8.802 \times \rho^2 \times 10^{-6}) \times [1 - 0.01 \times (w + a + s)] + 0.0942 \times s$$

For marine distillate fuels,

$$N = (46.423 - 8.792 \times \rho^2 \times 10^{-6} + 3.170 \times \rho \times 10^{-3}) \times [1 - 0.01 \times (w + a + s)] + 0.0942 \times s - 0.02449 \times w$$

$$G = (51.916 - 8.792 \times \rho^2 \times 10^{-6}) \times [1 - 0.01 \times (w + a + s)] + 0.0942 \times s$$

Where :

N (MJ/kg) = Net specific energy

G (MJ/kg) = Gross specific energy

ρ (kg/m³) = Density at 15°C

w (mass %) = Water content

a (mass %) = Ash content

s (mass %) = Sulfur content

Ref. ISO 8217:2017(E)

* Refer to that the actual specific energy test method (for example ASTM D 240) takes priority over the specific energy calculation method as above.

6.7 Internal fuel gas system

Diagram for Internal fuel gas system

*) Supply scope and instrument will be determined by EOD(Extent of Delivery) and engine builder's standard.

Figure 6.5 Diagram for internal fuel gas system [BP0061847-0.4]

Table 6.12 External pipe connection size

Code.	Description	Size
G1	Fuel gas inlet (double wall)	50A SCH.40 100A SCH.10
G3	Fuel gas ventilation	10K-25A
G7	Air inlet to double wall pipe	5K-40A

1. Connection size is according to JIS B 2220.
2. Scope of instrumentations will be followed according to the extent of delivery and the engine builder's standard.

Table 6.13 System components

No.	Description	Remark
1	Fuel gas venting valve	
2	Fuel gas safety filter	80μm
3	Gas admission valve	

6.7.1 General description

In gas mode, the regulated fuel gas from the external fuel gas system is to be injected to the intake port of each cylinder by gas admission valve. The gas and air mixture is led into the main combustion chamber through an intake valve and ignited by pilot fuel oil.

At the time of the change over from gas to diesel (including gas trip condition), emergency stop in gas mode or maintenance work of gas supply line, fuel gas should be purged out with inert gas (Nitrogen) with dry & clean, which is supplied from the gas regulating unit.

The fuel gas pipes on the engine are made of double walled structure up to the gas admission valves for the safety from the gas leakage. The annular intermediate space of double walled pipes shall be continuously ventilated under the negative pressure by the ventilation fan.

Gas admission valve

Fuel gas is injected by the gas admission valves into the intake port of each cylinder with suitable timing and duration. To regulate the power and speed of the engine, the amount of fuel gas fed into each cylinder is individually controlled by the gas admission valves which receive the signals from engine control system (ECS).

The gas admission valves are enclosed by the molded-cases which are connected to the annular intermediate space of double walled pipes. Therefore, it is possible to detect the gas leakage from the valves by the gas detectors equipped with the external double walled pipes at yard system.

Safety filter

To protect the gas admission valves, a safety filter with a fineness of approx. 80 μm is installed at the entrance of each gas admission valve.

Gas ventilation valve

The valve has special design for not only gas vent but also ventilation air inlet to annular intermediate space of double walled pipe.

In case of emergency stop in gas mode or gas trip, the gas ventilation valve is to be operated according to the specific sequence in order to vent out the fuel gas in double walled gas pipe on DF engine.

Fuel gas vent line should not be common with any other pipes to prevent unintended gas flowing to the other engine due to risk for backflow of gas and it should be led to open space with non-hazardous area where no any ignition sources is existed.

Please refer to relevant rules and class regulation for further requirements regarding gas vent line. The pressure drop in fuel gas vent line is to be designed as minimum as possible.

6.7.2 Annular intermediate space of double walled pipe

The annular intermediate space of double walled pipe should be continuously ventilated under the negative pressure suctioned with ventilation fan unit and the ventilation air is supplied through ventilation air inlet (G7) or ambient air in engine room (see the Figure 6.5).

The ventilation air inlet is located at gas ventilation valve of engine and the ventilation air should be came from gas safe area. Please refer to relevant rules and class regulation for further requirements regarding air ventilation.

Table 6.14 Double walled gas pipe external volume

Engine type	Double walled gas pipe external volume (Annular space) (liter)
6H27DF	41.2
7H27DF	46.0
8H27DF	50.8
9H27DF	55.6

6.7.3 Purging with inert gas

In order to secure safety, the crankcase and double walled gas pipe of HiMSEN DF engine should be purged with inert gas in case of emergency stop in gas mode, gas trip or before maintenance. The inert gas for purging of fuel gas piping is supplied through gas regulating valve unit according to purging sequence controlled by ECS (Engine control system). In case of purging for crankcase, it would be only conducted by manually before maintenance such as opening the crankcase door.

Inert gas to double walled gas piping

Connection code : G16 or G17 (See the Figure 6.5 Diagram for external fuel gas system)

Supply pressure : minimum 3 barg / maximum 6 barg

Alarm set point : 3.5 barg

Recommended : 4.0 barg

Table 6.15 Double walled gas pipe internal volume

Engine type	Double walled gas pipe internal volume (liter)
6H27DF	26.7
7H27DF	30.7
8H27DF	34.6
9H27DF	38.5

Inert gas to crankcase

Connection code : L6 (see the Figure 7.1 Diagram for internal lubricating oil system)

Supply pressure : minimum 3 barg / maximum 6 barg

Required inert gas volume : 8.5 Nm³ (1 atm, 0°C)

Table 6.16 Crankcase volume

Engine type	Crankcase volume (liter)
6H27DF	4,351
7H27DF	4,892

6.8.1 General description

In order to supply fuel gas to the engine, fuel gas passes through the external fuel gas system in order to ensure stable operation with correct pressure and temperature.

6.8.2 Double walled gas piping

The fuel gas supply pipes in the engine room should be double walled and connected to the gas regulating valve unit space. The design of the gas pipe should satisfy the requirements of classification societies.

The annular intermediate space of double walled pipes should be continuously ventilated by negative pressure suctioned by ventilation fan. The gas leakage from the inner pipes is to be monitored by the gas detectors at all times.

The ventilation system for the double walled gas pipes should be equipped with the minimum capacity of 30 air changes per hour, and the differential pressure of annular space should be monitored to check possible loss of the negative pressure.

6.8.3 Gas detector

The annular intermediate space of double walled gas pipe should be continuously ventilated under the negative pressure at the gas regulating unit room / gas regulating unit enclosure and the gas leakage from annular intermediate space of double walled gas pipe is monitored by gas detector.

In the 'Figure 6.5 Diagram for the external fuel gas system', the location and number of gas detectors are described which are generally accepted.

Please refer to relevant rules and class regulation for further requirements regarding the location, number and alarm limit of gas detectors.

6.8.4 Ventilation fan

To keep the annular intermediate space of double walled pipe under negative pressure, the ventilation fan should be applied.

The preliminary design value for the negative pressure is - 20 mbar, but the actual pressure might be various depending on the design of annular space. It could be accepted by appropriate analysis or measurement.

The minimum capacity for the ventilation fan is 30 air changes per hour according to the class regulation.

It is necessary to design the ventilation fan to consider the volume and pressure drop value of the annular intermediate space in order to achieve the minimum capacity as 30 air changes per hour. Please refer to the 'Figure 6.4 Diagram for internal fuel gas system' for further information for HiMSEN DF engine double walled fuel gas piping.

Please refer to relevant rules and class regulation for further requirements regarding air ventilation.

6.8.5 Master fuel gas valve

The master fuel gas valve is required to install at the upstream of the gas regulating unit according to relevant rules. It should be located outside the engine room.

6.8.6 Adjustable orifice for air inlet

In case of external fuel gas system with enclosed type gas regulating unit, there are two ventilation air inlet in the system. One is located in gas venting valve (G7) HiMSEN DF engine. The other should be located at annular space of fuel gas supply line. This adjustable orifice should be applied at the air inlet of annular space of fuel gas supply line in order to adjust the ventilation air balancing with G7 connection.

Please refer to relevant rules and class regulation for further requirements regarding air ventilation.

6.8.7 Gas supply pressure

The gas supply pressure to HiMSEN DF engine system depends on the minimum lower heating value of the fuel gas and pressure drop. Also, the gas supply pressure should be constantly supplied for stable gas mode operation.

Please refer to the 'Figure 5.2 Gas supply pressure at engine inlet' for detail information.

6.8.8 Gas regulating valve unit

The fuel gas is supplied to the engine through the gas regulating valve unit. The fuel gas pressure is adjusted by pressure regulator with I/P convertor, which is controlled by engine control system (ECS).

The gas regulating valve unit is required for each engine and it should be equipped with the ventilation fan and gas detection system.

Installation

The gas regulating valve unit shall be located as close to engine as possible for stable gas mode operation. Therefore, the distance between the fuel gas inlet of HiMSEN DF engine and gas regulating valve unit is recommended within 10 m (Maximum 20 m).

Type of gas regulating valve unit

- ✓ Open type gas regulating valve unit (GRU)

It should be installed in separated room so-called GRU room with appropriate ventilation system and gas detection system.

- ✓ Enclosed type gas regulating valve unit (ED Type GRU)

The ED TYPE GRU that has enclosure such as separated room so-called GRU room. It should be equipped with appropriate ventilation system and gas detection system.

The major function of gas regulating valve unit

- ✓ Measuring gas consumption (optional)
- ✓ Filtering fuel gas
- ✓ Control of the fuel gas pressure supplied to HiMSEN DF Engine
- ✓ Stopping fuel gas supply to engine in case of emergency stop or gas trip
- ✓ Purging fuel gas line

The comprisal of gas regulating valve unit

- ✓ Manual shut-off valve
- ✓ Gas filter
- ✓ Flow meter (option)
- ✓ Gas pressure regulator
- ✓ I/P converter
- ✓ Double block and bleed valve for fuel gas line
- ✓ Double block and bleed valve for inert gas line
- ✓ Gas ventilation valve
- ✓ Closable non return valves
- ✓ Instruments (Pressure indicator, sensor, temperature indicator, transmitter)
- ✓ Inert gas filter with differential pressure switch

Gas filter

The gas filter protects the downstream equipment like the pressure regulators from impurities such as dust, rust, and other solid particles. The filtration of the gas filter is abs. 2 micron, 99 % efficiency.

The pressure loss at this filter is monitored by the front and the rear of pressure transmitter.

Flow meter (Option)

The Flow meter can measure flow rates directly and integrate the measured values. As a result, the gas volume which flowed through the flow meter is registered by an electronic totalizing unit. The pressure loss at this filter is monitored by the front and the rear of pressure transmitter.

Double block valve

The double block and bleed valve (DBB valve) is composed with two shut off valves (block valves) and one vent valve (bleed valve) between the shut off valves. The two shut off valves cut off the fuel gas supply to the DF engine according to specific sequence controlled by Engine Control System (ECS). And the vent valve will be opened to release the trapped fuel gas between shut off valve at the same time. The block valves are designed for normal close (fail to close) and bleed valve is designed for normal open (fail to open) for fuel gas system safety.

The double block and bleed valve is arranged in fuel gas line and inert gas line.

To check for any leakage from the double block valves, close the valves and check the pressure right in front of the valves. If there is any pressure drop, it means that the gas is leaked from these valves.

Gas pressure regulating valve

The fuel gas supply pressure to DF engine is controlled by gas pressure regulating valve. It is controlled by the ECS through the I/P converter which transforms the electronic signals into the control air pressure.

Purging with inert gas

When emergency stop in gas mode or gas trip, fuel gas in double walled gas pipe should be purged out with inert gas (nitrogen). The inert gas for purging of fuel gas piping is supplied through gas regulating unit according to purging sequence controlled by ECS (Engine control system).

Gas vent line

Fuel gas vent line should not be common with any other pipes to prevent unintended gas flowing to the other engines due to risk for backflow of gas and it should be led to open space with non-hazardous area where there are no any ignition sources. Please refer to relevant rules and class regulation for further requirements regarding gas vent line.

Annular intermediate space volume for Enclosure : 950 liter

6.9 Fuel gas specification

Fuel gas characteristics

For continuous operation without reduction at the rated output, the fuel gas has to fulfill the below fuel gas quality requirements. In order to avoid operational problems such as de-rating, corrosion, wear, lube oil contamination etc., the fuel gas composition must be submitted to the engine manufacturer.

Table 6.22 Fuel gas characteristics

Property	Unit	Value
Lower calorific value (LCV), min. ³⁾	MJ/Nm ³ ¹⁾	28
Methane number (MN), min. ²⁾	-	70
Methane (CH ₄) content, min	Vol %	75
Total content of C ₃ , C ₄ , C ₅ , C ₆ , Heavier, max (Propane, Butane, Pentane, Hexane, Heptane, Octane, Cetane ...)	Vol %	3
Particles or solids at engine inlet, max	μm	5
Particles or solids at engine inlet	mg/Nm ³	50
Hydrogen sulphide content (H ₂ S), max	mg/Nm ³	30
Gas inlet temperature	°C	0 ~ 50
Oil content, max	mg/Nm ³	0.01
Water or liquids	Condensate not allowed at engine inlet	

1) Reference condition for the volume designation Nm³ (Temperature 0 °C, Atmospheric press. 1.013 bar)

2) The MN of the fuel gas is to be calculated by using "AVL Methane version 3.20 " of AVL's software.

2), 3) HHI-EMD has to be contacted for further evaluation, in case the lower heating value is in the range of 28 ~ 36 MJ/Nm³ or the MN is in the range of 70 ~ 80.

7 Lubricating oil system

7.1.1 General description

The engine has its own internal lubricating oil system with the wet type oil sump, which supplies lubricating oil to all moving parts for lubricating as well as cooling. Most of oil passages are incorporated into engine components and equipment in the system, which are mounted directly on feed module without pipe connections.

The internal lubricating oil system comprises following equipment :

- ✓ Lubricating oil cooler
- ✓ Engine driven lubricating oil pump (with pressure regulating valve)
- ✓ Electric motor driven pre-lubricating pump
- ✓ Lubricating oil thermostatic valve
- ✓ Lubricating oil filter
- ✓ Wet sump tank
- ✓ Centrifugal oil filter
- ✓ Oil mist detector

Quantity of lubricating oil (wet sump)

Table 7.3 Total quantity of lubricating oil inside the engine

Engine type	Oil quantities in liter			
	720 / 750 rpm		900 / 1000 rpm	
	Min.	Max.	Min.	Max.
6H27DF	980	1240	1210	1460
7H27DF	1100	1380	1340	1630
8H27DF	1210	1530	1490	1800
9H27DF	1330	1670	1620	1970

Lubricating oil consumption

Gas mode : 0.25 g/kWh

Diesel mode : 0.4 g/kWh

- ✓ Tolerance : +25 % depending on the operating condition
- ✓ Only maximum continuous rating should be used to evaluate the lubricating oil consumption.

Engine driven lubricating oil pump

The engine driven lubricating oil pump is a gear type, mounted on the feed module of the engine. The pump is designed to provide sufficient flow even at low speed.

Pre-lubricating oil pump

The pre-lubricating pump is gear type, and electric motor driven. The pre-lubricating pump is automatically started to operate when engine is stopped. And the pre-lubricating is required during the engine stop period if the fuel oil is circulating. In case that the automatic pre-lubrication has been switched off, the engine must be pre-lubricated sufficiently before starting up.

Lubricating oil cooler

The lubricating oil cooler is plate type, mounted on the feed module of the engine.

Thermostatic valve

The thermostatic valve is the wax element type, working at fixed temperature range of 60 ~ 69 °C, is mounted on the feed module of the engine.

Lubricating oil filter

The lubricating oil filter is duplex paper cartridge type, mounted on the feed module of the engine. Each filter has a safety cartridge of stainless steel.

- ✓ Paper cartridge fineness : 15 μm
- ✓ Safety cartridge fineness : 60 μm

Pressure regulating valve

The pressure regulating valve adjusts inlet pressure after lubricating oil filter at 4 ~ 5 bar and is mounted on feed module of the engine.

Centrifugal oil filter

Centrifugal oil filter can be mounted on engine. The centrifugal force is taken from the oil pressure.

Lubricating oil sump drain

It is recommended to use the separator suction pipe for draining of the lubricating oil sump.

7.2 External lubricating oil system

Diagram for external lubricating oil system

Figure 7.2 Diagram for external lubricating oil system

Table 7.4 System components

Code	Description	Code	Description
TK-601	System oil tank	HE-601	Pre-heater for the separator
TK-602	Storage tank	SP-601	Separator
TK-603	Sludge tank	PP-602	Feed pump for the separator
TK-604	Separated oil tank	FT-601	Suction strainer

7.2.1 General description

The external lubricating oil system is required for not only cleaning but also heating the oil to start the engine quickly. The system shall be used commonly for all auxiliary engines.

Though filtering equipment built on engine shall be sufficient for the engine operating with natural gas or marine gas oil, the centrifugal purification is commonly required for marine diesel oil and heavy fuel oil operation.

7.2.2 Lubricating oil separator

Self-cleaning type or manual cleaning type separator can be used.

Separator capacity

The separators should be dimensioned for continuous operation and following formula can be used, as a guidance, for estimating the required flow for the separator capacity :

$$F = p \times 1.4 \times n / t$$

Where :

F (l/h) = required flow

p (kW) = total engine output

n = number of oil circulation per day (4 for marine diesel oil / marine gas oil / natural gas, 6 for heavy fuel oil)

t = actual separation time per day (Normally, 23 hour)

For the simple estimation, above formula can be expressed as follows :

$$F = 0.3 \times p \text{ (l/h)}$$

The below formula is used to find the rated capacity for the separator :

$$V = F / B \text{ (l/h)}$$

Where :

V (l/h)= rated capacity for the separator

F (l/h)= required flow

B = throughput factor (0.2 ~ 0.25)

Throughput factor (B) shall be in accordance with the separator maker's recommendations.

Separator installation

The separator should be in continuous operation while the engine is on running in order to ensure removal of contaminants as quick as possible. If possible, the separator should be in operation also when the engine on shut-down for the reducing of the contamination level. In the latter case, oil temperature for efficiencies of separation needs to be maintained through heaters. Those installations with their separation plant shut down during engine stop, should consider re-starting the separator prior to engine start-up because contamination (engine leaks, condensation) could occur during engine stop.

With multi-engine plants, It would be the best to install one separator per each engine (Figure 7.3). The cleaning systems of auxiliary engines are often designed such that the separator intermittently serves on engine at a time. If only one separator is in operation, the following layouts can be used (Figure 7.4).

Oil cleaning, the discharge depending upon the operating time between two periods of oil cleaning the discharge interval may have to be shortened during the first couple of hours. In this way the separator will be able to cope with the high level of contaminants at the beginning of the cleaning phase. The appropriate discharge interval has to be found by trial and error.

It is important that maintenance and operation of the separator should be performed according to the manufacturer's recommendations.

Figure 7.3 Principle layout for direct separating on single engine

Figure 7.4 Principle layout for direct separating on multi engines

Figure 7.5 Principle layout for overflow system

It should be ensured that the separator is only connected with one engine at a time. In order to ensure that there is no suction and discharging from one engine to another.

To provide the mentioned above, it is recommended that inlet and outlet valves can be changed over simultaneously.

With only one engine in operation, there are no problems with separating, but if multi engines are in operation for some time, it is recommended to split up the time so that there is separation on all engines, which are operating in turns.

Overflow system

In some cases, overflow system can be applied as an alternative for continuous purification (Figure 7.5). In order to have a better syphon effect, the overflow pipe from sump to overflow tank should have a continuous downward gradient of minimum 10 degrees without high and low point.

Suction strainer

0.8 ~ 1.0 mm mesh size of suction strainer should be inserted before the separator pump.

Pump for separator

The pump can be either directly driven by the separator or driven by an independent motor as recommended from a separator maker.

Heater for separator

The lubricating oil in wet sump tank and in the system is to be warm-up to 40 °C from the separator heater prior to engine starting. The lubricating oil in sump tank is to be heated-up to approx. 65 °C in engine service. Heater for separator is to be designed to heat the lubricating oil from 65 °C up to 95 ~ 98 °C according to separator maker's recommendation.

If the separation temperature is lowered from 95 °C to 90 °C, the separator throughput has to be reduced by 22 % to maintain the same separation efficiency.

7.2.3 Velocities and pressure losses

In order to prevent excessive pressure losses in the piping system, we recommend that the lubricating oil velocity should not exceed :

- ✓ Suction pipe : 0.5 ~ 1.5 m/s
- ✓ Pressure pipe : 1.0 ~ 2.5 m/s

7.2.4 Crank case ventilation

Where two or more engines are installed, vent pipes, if fitted, and lubrication oil drain pipes should be independent to avoid inter circulation between crankcases.

- ✓ The crankcase vent pipes from each engine shall be led independently to a safe location outside of engine room distant from any source of ignition. The pipes should not be connected to any other branch such as a tank vent, etc.
- ✓ The outlet of vent pipe is to be fitted with corrosion resistant flame screen separately for each engine.
- ✓ The vent pipe should have a continuous upward gradient of minimum 10 degrees without high point or low point.
- ✓ The vent pipe should be equipped with condensate trap and drain within 1~2m from the engine.
- ✓ The connection between the engine and yard vent pipe is to be flexible, if resilient mounting is applied.
- ✓ The dimension of the flexible connection is 125 A, and the vent pipe size after the flexible connection must be min. 125 .A.
- ✓ The oil mist should not be gone into suction side of intake duct located outside (for outdoor type) or engine room (for indoor type)
- ✓ Inert gas purging in the crank case is required manually before crankcase door open through L6 connection. The volume of the inert gas is referred to [6.7.3 purging with inert gas]
- ✓ The oil mist with air and gas mixture would be vent out from crankcase lube oil vent during gas mode operation.

7.2.5 Crankcase gas detection

The crankcase of trunk-piston type and Otto cycle gas fueled engine may contain very small amount of fuel gas due to blow-by gases. In case that the gas detection in the crankcase is required by classification societies, a shipyard should install a gas detection system in the crankcase vent pipe after the engine.

- ✓ The gas detector should be located away from the crankcase vent connection of the engine and recommended to be installed on the sampling line fitted on the crankcase vent in parallel.
- ✓ The appropriate arrangement should be considered to prevent the gas detector from being contaminated by oil vapor and/or particles.
- ✓ The gas detector should be selected and calibrated according to the detector maker's recommendation based on components and characteristics of mixed gas in the crankcase.

For example, Consilium's Band B type gas detector(*) has to be calibrated in accordance with the below table provided by Consilium's guidance.

(*) The Band B type gas detector may be physically marked as Searchpoint Optima Plus gas detector. The Honeywell's Searchpoint Optima Plus gas detector is supplied to Consilium, and Consilium renames the gas detector as Band B type.

Gas	Calibration gas concentration	Detector response at calibration
Methane (CH ₄)	70% LEL	42% LEL
	50% LEL	30% LEL

Remark: LEL - Lower explosive limit

The values are only for reference and it is not guaranteed by an engine manufacturer. Therefore, please contact to the gas detector maker which is installed on the external system for appropriate values for each gas detector.

- ✓ The gas detector's alarm level should be arranged by the yard according to the classification societies' requirement for the gas fueled internal combustion engines.

7.3 Lubricating oil specification

7.3.1 Oil grade

The medium-alkaline, heavy duty (HD) oils in API-CD class have to be used for HiMSEN engine including turbocharger lubrication. Please refer to the Table 7.7.

7.3.2 Oil viscosity

The oil viscosity is based on SAE 40 oil and recommended to be 145 mm²/sec. at 40 °C.

Initial oil heating to 40 °C is necessary prior to engine start.

7.3.3 Governor oil grade

In case of the hydraulic governor, an independent oil system is required. For further information, please refer to the Table 7.7.

BN value

BN (Base Number) is a measure of the alkalinity or basicity of the oil. It is expressed in milligrams of potassium hydroxide per gram of the oil (mg KOH/g).

Alkalinity in lubricating oil is necessary to neutralize the acidic combustion products coming from the sulfur in fuel. Therefore, lubricating oil with suitable BN should be selected to maintain proper balance between alkalinity in lubricating oil and the sulfur level in fuel after consulting with lubricating oil supplier or specialist.

- ✓ High sulfur fuel + low BN lubricating oil → Excessive corrosive wear
- ✓ Low sulfur fuel + high BN lubricating oil → Excessive top land deposit formation, → Lacquering formation on cylinder liner surface

7.3.4 Lubricating oil selection

The general lubricating oil BN selection strategy is to match the lubricating oil with the fuel sulfur contents (%). Because BN decreases at various rates in each engine and condition, lubricating oil consumption also should be considered to have sufficient equilibrium during operation.

DF engines can be operated using natural gas, distillate fuel and residual fuel, and these fuels have different sulfur level.

For the recommendation considering the lubricating oil BN, please refer to the following table. If DF engines are operated in turn on three fuels with natural gas as main fuel and distillate / residual fuel as auxiliary fuel, limitations of auxiliary fuel should be followed based on residual fuel.

Refer to the 6.4 and 6.9 for specification of fuel oil and fuel gas.

Table 7.5 Recommended BN for DF engine operation cases

Aux. fuel \ Main fuel		Natural gas	
		No sulfur	
Natural gas	No sulfur	BN 3 ~ 7	
Distillated fuel (MGO / MDO)	- 0.1% S	BN 3 ~ 7 with limit ¹⁾	
	0.1 - 0.5% S	BN 3 ~ 7 with limit ¹⁾	
Residual fuel	ULSFO	- 0.1% S	BN 15 ~ 20 with limit ²⁾
	VLSFO	0.1 - 0.5% S	BN 15 ~ 20 with limit ³⁾
	HSHFO	0.5 - 3.5% S	BN 20 ~ 30 with limit ⁴⁾
		3.5 - % S	BN 30 ~ 40 with limit ⁵⁾

Table 7.6 Limitation (Allowed Max. operating hours)

Limit	X (Fuel kinds)	'X' fuel operating hours / Total monthly cumulative operating hours	Required BN
1	Distillated fuel	≥ 15 %	10 ~ 15
2	ULSFO	0 ~ 5 %	3 ~ 7
		5 ~ 10 %	10 ~ 15
		10 ~ 15 %	15 ~ 20

8.1.1 General description

The engine has two cooling water circuits internally, which are low temperature and high temperature water circuits. Most of the components of circuits are modularized and directly mounted on the feed module. Please refer to Figure 2.4.

Low temperature water circuit comprises :

- ✓ Engine driven pump
- ✓ Charge air cooler
- ✓ Lubricating oil cooler
- ✓ Motor operated valve type thermostat

High temperature water circuit comprises :

- ✓ Engine driven pump
- ✓ Charge air cooler
- ✓ Engine water jackets and cylinder heads
- ✓ Wax type thermostat, dividing type (temp. range : 79 ~ 88 °C fixed)
- ✓ Motor operated valve type thermostat (option)

Scope of supply

The internal cooling system consists of the following built-in equipment :

- ✓ Engine driven low temperature cooling water pump
- ✓ Engine driven high temperature cooling water pump
- ✓ One stage charge air cooler
- ✓ High temperature cooling water control thermostatic valve
- ✓ Electric pre-heater unit (option)

1. Low temperature cooling water control thermostatic valve is to be installed on external piping of engine.

8.2 External cooling water system

HE-701	Central cooler	TV-705	Thermostatic valve for low temperature water
HE-703	Preheater for high temperature cooling water	PP-701	Circulation pump for fresh water
TV-701	Thermostatic valve for central cooling	PP-703	Circulation pump for preheating

8.2.1 General description

Pressure drop

- ✓ Engine high temperature cooling water system : approx. 0.5 bar
- ✓ Charge air cooler : approx. 0.5 bar
- ✓ Lubricating oil cooler : approx. 0.2 bar
- ✓ Thermostatic valve : approx. 0.5 bar

(These values shall be different depending on the actual design of each vessel or plant.)

Fresh water velocity

- ✓ Max. 2.5 m/s

Sea water velocity

- ✓ Suction pipe : 1.0 ~ 1.5 m/s
- ✓ Delivery pipe : 1.5 ~ 2.5 m/s

Expansion tank

To avoid cavitation in cooling water system, a certain suction head for engine driven high temperature cooling water pump is required as follows :

- ✓ Minimum head : 0.5 bar (5 meters above the crank shaft level)
- ✓ Tank volume : 200 liter + α^1

1. α : Min. 10% of high temperature cooling water and low temperature cooling water volume of each engine(s).

Table 8.5 Cooling water volume of the engines

Engine type	High temperature cooling water and low temperature cooling water volume
6H27DF	460 liter
7H27DF	480 liter
8H27DF	500 liter
9H27DF	520 liter

In unusual situation, the fuel gas could be enter into expansion tank. This unburned gas should be vent out through ventilation pipes to the safe zone on the open deck.

Central cooling

The central cooler for fresh water can be of the tube or plate type, which can be common for several engines or separate for each engine.

1) Fresh water side

- ✓ Flow quantity and heat dissipation : Refer to '3.2 engine capacity data'.
- ✓ Pressure drop : maximum 0.5 bar.
- ✓ Pump : centrifugal type (Electric motor driven)
- ✓ Water temperature before engine : 36 °C

2) Sea water side

- ✓ Flow quantity : 1.1 ~ 1.5 times of fresh water flow
- ✓ Pressure drop : 1.0 ~ 1.5 bar

8.2.2 Cooling water pressure of engine inlet

Pressure of engine inlet should be kept under 2.5 bar.

8.2.3 Cooling water

The cooling water system is designed for using normal fresh water with dosing corrosion inhibitor.

If sea water or other coolant system should be applied, please contact the engine maker separately in advance.

Pre-heating

In order to ensure start of engine and quick load up, pre-heating facility must be installed on the internal or external cooling water circuit. Pre-heating for all engines are required.
Pre-heating temperature :

- ✓ Marine diesel oil operation : minimum 40 °C
- ✓ Heavy fuel oil operation : minimum 60 °C
- ✓ Heating capacity : approx. 3.5 kW/cyl.

8.3 Cooling water quality and treatment

8.3.1 Quality of cooling water

The cooling of the engine should be done by only distilled (demineralized) or fresh water, which should be checked and treated to satisfy following requirements below table before adding corrosion inhibitor.

It is necessary for keeping effective cooling and preventing corrosion of the system.

Though the distilled water fully satisfy to the requirements for cooling water, it is necessary to add corrosion inhibitor before applying cooling water to engine cooling water system because untreated cooling water absorbs carbon dioxide from the air and then becomes corrosive.

Table 8.6 Quality of cooling water

pH	7 to 9
Total Hardness as CaCO_3	Maximum 75 ppm (mg/l)
Chlorides Cl^-	Maximum. 80 ppm (mg/l)
Sulphates as SO_4^{2-}	Maximum 100 ppm (mg/l)
Silica as SiO_2	Maximum 60 ppm (mg/l)
Residue after evaporation	Maximum 400 ppm (mg/l)

1. Chloride and Sulphate are corrosive even in the presence of an inhibitor.

Sea water or fresh water contaminated by sea water even in small amount is not allowed to be used as cooling water of the engine due to high risk of severe corrosion and deposits formation in the system.

Rainwater is heavily contaminated and highly corrosive in general, which is also not recommended as cooling water.

Tap water (drinking water) is not recommended as cooling water due to risk of chalk deposit formation inside the cooling system.

However, if the distilled water, for example from fresh water generator, is not available, tap water may be used as cooling water after softening and some other treatments according to the ingredients.

8.3.2 Treatment of cooling water

Cooling water should be treated properly and corrosion inhibitor should be added.

The analysis and treatment of cooling water are recommended to be carried out by experts. Otherwise, comply the treatment procedures strictly according to the instructions from the supplier.

The recommended products are listed in following table.

Table 8.7 Recommended products list

Manufacturer	Brand name	Constituent	Delivery form	Recommended Dosage
Chevron (FAMM)	DELO XLI(Havoline XLI)	Carboxylates	Liquid	75 liter / 1000 liter
VECOM	Cooltreat NCLT	Nitrite	Liquid	48 liter / 1000 liter
Wilhelmsen Chemicals	Rocor NB	Nitrite, Borate	Liquid	63 liter / 1000 liter
NALCO	NALCOOL2000, TRAC102	Nitrite, Borate	Liquid	128 liter / 1000 liter
	TRAC100	Molybdate, silicate	Liquid	17.5 liter / 1000 liter
	TRAC115,TRAC108	Nitrite, Borate	Liquid	28 liter / 1000 liter
GE	CorrShield NT4200	Nitrite	Liquid	30 liter / 1000 liter
Water and Process Technologies				
Shell	Shipcare Cooling Water Treat	Nitrite, Borate	Liquid	128 liter / 1000 liter
Drew marine	LIQUIDEWT	Nitrite	Liquid	24 liter / 1000 liter
	MAXIGARD	Nitrite	Liquid	64 liter / 1000 liter
Houghton	Tectyl CW-70N-TEA	Nitrite	Liquid	66 liter / 1000 liter

1. Follow the guidelines of corrosion inhibitor manufacturer for cooling water treatment.
2. Oily inhibitors adhere to cooling surface and influence cooling efficiency, which are not recommended for cooling water. Only nitrite-borate based inhibitors are recommended.
3. Some inhibitors may be toxic and hazardous. Strict control is required when handling inhibitors.

9 Air and exhaust gas system

9.1 Internal compressed air system

Diagram for internal compressed air system

*) Supply scope and instrument will be determined by EOD(Extent of Delivery) and engine builder's standard.

9.1.1 General description

Compressed air is supplied for engine start, emergency stop, dual valve timing, slow turn, waste gate valve and gas ventilation valve as for the control air. In addition, the start block is activated in case of turning gear engagement. The detail information of engine operation is explained in the chapter '5. Operation and control system'.

Starting system

Starting system mainly consists of a relay valve, a starter's main valve, and an air starting motor. When the engine is started, the compressed air with the pressure of maximum 30 bar flows through the air start motor, then the motor turns a flywheel with a gear.

Engine stop

The emergency stop valve is incorporated into the main starting valve module. It is for immediate engine stop. In the emergency stop in diesel mode operation, emergency stop cylinder pushes the governor linkage not to move the fuel pump racks.

Dual valve timing

Dual valve timing (DVT) adjusts the intake valve close timing to provide optimal combustion condition in low load operation. It consists of on-off solenoid valve and DVT units for each cylinder. When the solenoid valve opened, the compressed air with pressure reducing goes to cylinders in DVT units and makes the delay of the intake valve close timing.

Slow turn

Slow turn system is included in the air starter complete. It is a few flywheel revolutions without fuel injection to ensure that there is no residual gas or other foreign liquids in the combustion chamber. In stand-by mode, slow turn is automatically conducted every 30 minutes before start. On the contrary, slow turn will be skipped when engine has been operated 30 minutes earlier.

9.2 External compressed air system

Diagram for external compressed air system

Figure 9.2 Diagram for external compressed air system

Table 9.3 System components

Code	Description	Code	Description
AR-01	Main air receiver	WS-01	Oil and water separator
AR-02	Aux. air receiver	AC-01	Main air compressor

9.2.1 General requirements

The maximum 30 bar for the compressed air system is required for engine operation. Therefore, all external supply system should be properly designed for this nominal pressure and also should satisfy the rules of corresponding classification society.

Dry and clean air is essential for the reliable function of the engine starting and control system.

Therefore, the compressed air supply system should include oil and water separating equipment. The air supply pipe to engine should also be arranged with slope and the water trap should be positioned at the lowest points.

9.2.2 Starting air volume of the engine

Air consumption per one start is specified in '3.2 engine capacity data'. The capacity of starting air vessel varies as per Classification Societies or Customer's requirement.

Volumes for three starts(include slow turn air volume) of one auxiliary engine are as follows;

Table 9.4 Starting air volume of the engines

Engine type	Volume (liter)
6H27DF	510
7H27DF	550
8H27DF	620
9H27DF	640

9.2.3 Compressed air specification

To ensure reliable engine operation and prevent damage to the components in the compressed air system, the compressed air must be free from contaminants such as particles, water, and oil. The required compressed air specification is as follows;

Table 9.5 compressed air specification

Starting air (A1 conn.)	
Design pressure	30 bar
Working pressure	15~30 bar
Compressed air quality at engine connection	ISO 8573-1:2010 [7:8:X]
Control air (A2 conn.)	
Design pressure	10 bar
Nominal pressure	7 bar (Working pressure 6.5~8 bar)
Compressed air quality at engine connection	ISO 8573-1:2010 [5:5:3]
Consumption	Max. 2.5Nm ³ /h

9.3 Internal combustion air system

Diagram for internal combustion air system

*) Supply scope and instrument will be determined by EOD(Extent of Delivery) and engine builder's standard.

Figure 9.3 Diagram for combustion and exhaust gas system [B92-128961-2.1]

Table 9.7 System components

No	Description	Remark
1	Turbocharger	
2	Charge air cooler	
3	Compressor washing device (Water vessel)	
4	EWG (Exh. gas waste gate valve)	

9.3.1 General description

The air required for combustion is taken from the engine room through a filter fitted on the turbocharger. It is imperative that the combustion air be free from sea water, dust and fumes etc.

Turbocharger

Turbocharger is a radial type with high efficiency and mounted on the feed module of the engine. The water washing systems for the compressor and turbine are supplied as standard.

Charge air cooler

Charge air cooler is one stage low temperature cooled type. In general, sea water cooled type charge air cooler is not recommended.

Water mist catcher

Water mist catcher is installed between charge air cooler and air chamber of engine block.

Exhaust gas waste gate valve

Waste gate is a butterfly valve in an exhaust by-pass channel, which controls the amount of exhaust gas that passes through the turbine.

Air chamber

Air chamber is incorporated into the engine block with large volume for even distribution of induced air to each cylinder.

Exhaust pipe system

Exhaust pipe system is modular pulse converter (MPC) type, which has better performance at high load with a simple arrangement and easy maintenance.

Water drain pipes

Water drain pipes are installed for the air chamber and water mist catcher.

Charge air by-pass valve

Charge air by-pass valve can be installed as optional.

9.4 External combustion air system

9.4.1 General description

As the engines consume considerable amount of air in the engine room directly, or the outdoor intake air system is required, the design of combustion air is important not only for man-working but also for engine running. Various requirements are applicable depending on the ambient condition but the minimum requirements and recommendations for the engines are described as follows.

9.4.2 Combustion air

Arrangement of intake air pipes should be made to supply fresh air for engine combustion, which should be free from any risk of water spray, exhaust gas, dust, oil mist and electric equipment, etc.

In case of the engine room intake air system, the intake air temperature of the engine room would be increased by the radiation heat from the engines and generators. Therefore, intake air ducts should be installed to face the air intake silencer for each turbocharger as close as possible.

In case of the outdoor direct intake air system, the independent intake air system should be applied for each turbocharger even for the case of engine with two or more turbochargers. A different intake air design for the engine of each project, please contact to HHI-EMD. The piping system of intake air should be considered to allow thermal expansion and harmful vibration to avoid stress of pipe. The end of deep slope position of intake air pipe, cleanable waste trap and water drain should be prepared.

Combustion air intake pipe system, the air velocity must not exceed 15 m/s during engine running. Prior to commissioning, the pressure loss must be checked at compressor side whether the depression of compressor air inlet must not exceed 200 mmWC as maximum. The measuring point is approx. 1 ~ 2 m before from the turbocharger air inlet casing.

Air consumption volume should be designed in accordance with '3.2 engine capacity data'.

Air filtration should be prevented from the outdoor's sand, cement, dust, and other particles. All particles size are not to be entered maximum 5 µm and above.

Oil bath type filter are generally used for the industrial area, cement plants, and sand winded area. Recommendable pressure loss of oil bath intake filter is 50 ~ 70 mmWC and even of fouled condition, it must be kept within 110 mmWC.

Environmental condition of maximum particle size of dust is typically applied depending on site.

- ✓ Non-industrial area in rain / dry condition : 0.8 / 2 µm
- ✓ Area of emissions, chimneys, work area : 60 µm
- ✓ Metropolitan area , residential / Industrial area : 7 / 20 µm
- ✓ Desert area, during sand storms : 500 µm

Ventilation of engine room

To determine the amount of air ventilation for an engine room, all heat sources of the engine room should be considered.

Total amount of ventilation of auxiliary engine = $Q_c + Q_r + Q_v$ (m³/h)

Where :

Q_c (m³/h) : Air required for engine combustion,

$Q_r = \frac{\text{Engine radiation heat (kJ/h)}}{\text{Air conditioning factor (} Q_a = 12 \text{)}}$

Q_v (m³/h) : Air required for other heat sources such as alternator and exhaust gas pipe , etc.

1. Should outdoor intake air system, and shut-off of air intake be necessary, a special provision is required as option.

9.5 External exhaust gas system

9.5.1 General description

Exhaust gas of the engine flows out from turbocharger to atmosphere via an external exhaust gas system, which may be comprised of expansion bellows, exhaust gas pipe, exhaust gas boiler (possibly) and silencer, exhaust gas ventilation unit, relief valve (or rupture disc), etc.

Independent exhaust gas system

Independent exhaust gas system should be prepared for each engine even for the case of common boiler system with other engines. In case of applied two or more turbochargers on a single engine, the exhaust gas pipes are recommended to be combined into a Y-type forked pipe. And each exhaust gas pipe have to be symmetric and each exhaust gas flow should be no interference.

Exhaust gas back pressure

Back pressure of the exhaust system in total is recommended to be less than 300 mmWC at maximum countious rating. The maximum back pressure should not exceed 500 mm WC at maximum countious rating. Please see the sheets '3.6 correction of fuel oil consumption' for the fuel consumption correction in case of exceeding 300 mmWC at maximum countious rating. The measuring position is approx. 1 ~ 2 m after the turbocharger gas outlet casing.

9.5.2 Velocity

External exhaust gas piping is recommended to be designed that velocity of exhaust gas through pipes should not exceed approximately 40 m/sec at maximum continuous rating.

Insulation

Insulation of the whole exhaust system is required for the safety and to reduce noise and loss of thermal energy, which, of course, should comply with requirements of classification society and other related authorities

9.5.3 Piping design for exhaust gas system

In order to have lower back pressure and thermal loss, following design consideration is required ;

- ✓ Pipe should be as short and straight as possible. Pipe bendings should be minimized and the bending radius should be as large as possible.
- ✓ A water separating pocket and drain that cover the entire exhaust system should be provided as close as possible to the engine outlet(to prevent the ingress of condensate and other foreign substances into the engine)
- ✓ Rigid (fixed) supports and movable supports must be provided considering the thermal expansion and vibration of pipes.
- ✓ The exhaust gas outlet of Turbocharger can be turned on request.

For more information, please refer to the sheet '9.6 external exhaust gas pipe connection'.

9.5.4 Expansion bellows

The expansion bellows has to be mounted between the turbocharger outlet and external exhaust gas pipe in order to compensate thermal expansion and mechanical vibration. The expansion bellows are supplied separately as standard. However, an additional expansion bellows may be required depending on the actual length of exhaust pipe in total.

1. The external exhaust pipe must not exert any force against the gas outlet on the engine.
2. The external exhaust pipe just on expansion bellows should be fixed rigidly so that turbocharger can be free from any forces from the external exhaust pipe.
3. The sturdy fixed-point support must be provided for the expansion bellows on the turbocharger. It should be positioned, immediately above the expansion bellows in order to prevent the transmission of forces, resulting from the weight, thermal expansion or lateral displacement of the exhaust piping, to the turbocharger.
4. The exhaust piping should be mounted with a slope towards the gas outlet on the engine. It is recommended to have drain facilities in order to be able to remove condensate or rainwater.

Installation procedure for expansion bellow

- ✓ The generating set (or engine) should be installed in its final position before any external pipes are connected.
- ✓ Remove the counter flange from the engine connection, if fitted.
- ✓ Fasten the counter flange temporarily to the outlet side of the bellows. For the correct orientation of the bellows (flow direction), see the dimensional drawing.
- ✓ Fasten the bellows to the engine temporarily.
- ✓ Align the external pipe to the counter flange. No axial, lateral or angular deflection of the bellows is allowed. Anchor the external pipe to the steel structure within 1 m from flange. Observe that the pipe clamping with bracket must be very rigid in order to prevent vibration and movement of the exhaust gas pipe. Most problems with bursting and vibration originate from poor clamping and support. Especially the support in the axial direction must be rigid.
- ✓ Put some temporary protection cover between the flanges in order to prevent debris from falling into the turbocharger.
- ✓ Tack weld the counter flange to the external pipe.
- ✓ Remove the bellows and weld the flange finally to the external pipe.
- ✓ Remove the protection cover. Place the bellows with gaskets between the flanges.
- ✓ Lubricate the threads of the connection screw with heat resistant grease and tighten first until finger tight. Finally tighten the screw in a diagonal sequence.
- ✓ Remove the guide bar between the flanges of the bellows.

9.5.5 Exhaust gas boiler

Thermal energy of exhaust gas can be utilized by boiler. Please refer to the sheets '3.2 engine capacity data' for the exhaust gas data. A boiler may be a separate unit for each engine or a common unit with other engines. In any cases, however, the exhaust gas line for each engine should be separated from other engine's exhaust gas lines.

The back-pressure through boiler should be minimized to be within limited level for total exhaust gas system.

9.5.6 Exhaust gas silencer

Exhaust gas silencer can be supplied as option on request. The noise attenuation of silencer shall be either 25 dB(A) or 35 dB(A). For more information, please refer to the sheets for '9.8 exhaust gas silencer with spark arrestor'

9.5.7 Exhaust gas ventilaton unit

The exhaust gas ventilation system is required to purge unburned gas through the exhaust gas system after stopping engine in gas operating mode.

The ventilation unit consists of a centrifugal fan, a pressure switch and a butterfly valve which can endure the high temperature of the exhaust gas system and should be designed to be gas-tight.

It is recommended to install the ventilation unit near the engine side, but the distance between the main stream of exhaust gas pipe and the ventilation unit should be kept over 2 meter.

Also, the branch pipe connection from the ventilation unit should not to head to the engine direction. The ventilation unit is controlled by engine control system automatically.

9.5.8 Relief valve (or rupture disc)

The relief valve (or rupture disc) is to be installed in the external exhaust gas system to discharge the over pressure caused by potential explosion effectively. The rupture disc outlet has to be located in the gas safe place far from ignition source.

9.6 External exhaust gas pipe connection

9.7 Approach of SCR (Selective Catalytic Reduction) system installation

9.7.1 General description

IMO NOx Tier III regulation was in effect from the year 2016 according to IMO's environmental policy, in which NOx emission should be reduced by 80 % level comparing to the IMO NOx Tier I. SCR system became one of proper solutions to meet the IMO NOx Tier III regulation.

The HiMSEN engine is able to be combined SCR systems provided by third parties. However, HHI-EMD recommends using Hyundai NoNOx SCR system for convenience such as testing NOx Scheme A test for EIAPP certificate and providing integrated technology. For detailed specifications of Hyundai NoNOx, please see the HYUNDAI HiMSEN ENGINE programme or contact to HHI-EMD.

Note !

The GAS mode operation of HiMSEN DF engines is met the IMO Tier III regulation without any aftertreatment equipment. However, if the diesel mode operation is required in emission controlled area (ECA), it should be installed an aftertreatment equipment such as the SCR in order to reduce the NOx emission on the vessel.

9.7.2 Boundary conditions for SCR operation

General boundary conditions for SCR operation :

Mode

- ✓ SCR operation is allowed in diesel mode, not gas mode

Main diesel fuel oil

- ✓ The diesel fuel for SCR should be selected according to the sulfur content in consideration of the sailing region and SCR specifications.

Exhaust gas temperature

- ✓ The minimum required temperature for SCR peration is determined by the sulfur content in fuel and SCR specifications.
- ✓ Exhaust gas temperature is controlled to increase by adjustable waste gate valve automatically for SCR active or ready condition.
- ✓ Exhaust gas SCR chamber bypass system need to be considered according to the gas mode exhaust gas temperature and SCR specifications.

Note !

When SCR units are installed, the heat loss of the exhaust gas pipe between engine and SCR chamber should be designed to be minimized in order to keep the required exhaust gas temperature. The supports of exhaust gas pipe should be designed and installed to minimize heat loss.

Maximum exhaust gas back pressure

- ✓ Allowable back pressure in total of the exhaust system to guarantee fuel consumption see the '9.5.1 General description'. It is not recommended that the exhaust gas's total back pressure exceeds 500 mmWC in diesel mode MCR (Maximum Countious Rating)

Other equipment installation such as exhaust gas boiler, silencer, etc. between the engine and the SCR chamber is not recommended in order to keep exhaust gas temperature.

Figure 9.5 Minimum required exhaust gas temperature for SCR operation

*) The minimum required exhaust gas temperature for SCR operation is confirmed through the document from SCR supplier.

9.7.3 Operation and performance change

The HiMSEN DF engine is equipped with a waste gate valve as standard design in order to control air /fuel ratio in gas mode operation. As the SCR system is installed, the waste gate valve can be used in diesel mode to increase the exhaust gas temperature in the SCR operation at certain loads which is lower exhaust gas temperature.

The waste gate valve is activated when the exhaust temperature is lower than required temperature in SCR mode. At this time, the exhaust gas temperature will rise until target temperature and the fuel consumption will be slightly increased in proportion to the valve operation.

The performance of gas mode is no difference because SCR operation is not necessary.

9.7.4 Exceptionals

In exceptional cases of SCR installation, please contact to HHI-EMD.

9.8 Exhaust gas silencer with spark arrestor

The silencer is of an absorption type delivered with spark arrestor and mounting bracket, excluding insulation. The silencer can be mounted horizontally or vertically.

The gas flow passes through a straight perforated tube, surrounded with an efficient sound absorbing material. The silencer gives whereby an excellent sound attenuation suitable for even a wide operating range.

The gas pressure will be dropped into an approximate value shown on the graph, pressure loss vs. gas velocity.

Figure 9.6 Exhaust gas silencer (25 dB type).

Table 9.10 Exhaust gas silencer size (25 dB type) (unit : mm)

Cylinder type	DN	A	B	C	D	E	F
6-7 (720 rpm)	450	3200	2900	150	810	800	1600

Engine type	H	PCD	OD	T	N-d	Weight (kg)
6-7 (720 rpm)	550	555	605	16	16-Ø23	865
6-8 (900 rpm) 8-9 (720 rpm)	600	605	655	16	20-Ø23	1035
9 (900 rpm)	630	620	660	16	16-Ø23	1165

9.9 Generator information

Mounting of generator

As a standard design of H27DF engine, the engine and generator are coupled with disc coupling and rigidly mounted on common base frame.

Generator bearing

Type of generator bearing is of single sleeve, self-lubricating type and mounted end of generator for H27DF engine.

Optional design

As special arrangement, double sleeve bearing, forced lubricating of generator bearing, cooler and flexible coupling can be applied as an optional design on request.

Figure 9.8 Disc coupling outline

HS6110	O-rings for lubricating oil pump	set	-	-	-	1 x U	1 x U	1 x U	1 x U	2 x U
HS6210	O-ring for lubricating oil cooler connection (installation on engine side)	set	-	-	-	10	10	10	10	20
HS6310	Lubricating oil filter cartridge (paper cartridge type)	ea	2 x U	4 x U	6 x U	8 x U	10xU	12xU	14xU	16xU

1. The list of consumable parts stated above is only for guidance as this depends on the actual service condition, the quality of used fuel or lubricating oil, the treatment of cooling water and so on.

Section No.	Parts description	Quantity for the operating hours								
		Set/ea	0 – 4000	0 – 8000	0 – 12000	0 – 16000	0 – 20000	0 – 24000	0 – 28000	0 – 32000

Lubricating oil System

HS6310	O-rings for lubricating oil filter assembly (paper cartridge type)	set	1 x U	2 x U	3 x U	4 x U	5 x U	6 x U	7 x U	8 x U
HS6410	O-ring for lubricating oil thermostat valve	ea	-	-	-	1 x U	1 x U	1 x U	1 x U	2 x U
HS6410	Gasket for thermostatic valve cover	ea	-	-	-	1	1	1	1	2
HS6320	Spare parts for centrifugal filter (See manual for centrifugal filter)	set	-	-	-	-	-	-	-	-

Cooling water system

HS7110	Oil seal, mechanical seal and O-ring for high and low temperature cooling water pump (if applied)	set	-	-	-	1 x U	1 x U	1 x U	1 x U	2 x U
HS7210	O-ring for cooling water thermostat valve (wax type installed on engine)	ea	-	-	-	1 x U	1 x U	1 x U	1 x U	2 x U
HS7210	O-ring for thermostatic valve housing (wax type installed on engine)	ea	-	-	-	1 x U	1 x U	1 x U	1 x U	2 x U
HS7310	O-ring for cooling water connection	ea	-	1	1	2	2	3	3	4
HS7320	O-ring for cylinder head cooling water connection	ea	-	8	8	(4xC)+6	(4xC)+6	(4xC)+14	(4xC)+14	(8xC)+12

Supercharging system

HS8110	Gaskets and O-ring for compressor out	set	-	-	-	1	1	1	1	2
HS8210	Gasket for connection flange	ea	-	1	1	1xC+1	1xC+1	2xC+1	2xC+1	3xC+1
HS8320	O-rings and gaskets for Turbocharger connection	set	-	-	-	1	1	1	1	2

- The list of consumable parts stated above is only for guidance as this depends on the actual service condition, the quality of used fuel or lubricating oil, the treatment of cooling water and so on.

Section No.	Parts description	Quantity for the operating hours								
		Set/ea	0 – 4000	0 – 8000	0 – 12000	0 – 16000	0 – 20000	0 – 24000	0 – 28000	0 – 32000

Charge air cooler

HS8410	O-rings and gaskets for air cooler	set	-	-	-	1	1	1	1	2
--------	------------------------------------	-----	---	---	---	---	---	---	---	---

Turbocharger

	Turbine nozzle ring (See manual for turbocharger)	ea	-	-	-	1	1	1	1	2
	Spare parts for turbocharger (See manual for turbocharger)	set	-	-	-	-	-	-	-	-
	Air filter mat (Engine room air suction)	ea	2	4	6	8	10	12	14	16

1. The list of consumable parts stated above is only for guidance as this depends on the actual service condition, the quality of used fuel or lubricating oil, the treatment of cooling water and so on.

10.3 List of standard spare parts

List of minimum spare parts for each plant or each ship (valid for all classification societies)

Table 10.3 List of standard spare parts

Parts description	Q'ty	Section No.	Item No.	Remark
Engine block and covers				
Main bearing	1	CDF13250	251	Upper and lower
Thrust washer	2	CDF13250	252	
Main bearing stud	2	CDF13000	231	
Nut for main bearing stud	2	CDF13000	232	
O-ring for crankcase door	1	CDF19300	384	
Cylinder head and cylinder liner				
Valve spindle, intake	2	CDF21200	201	
Valve spindle, exhaust	4	CDF21200	202	
Conical clamping piece	6	CDF21200	206	
Valve spring	6	CDF21200	203	
Valve seat, inlet	2	CDF21100	111	
Valve seat, exhaust	4	CDF21100	112	
Rotocap	6	CDF21200	204	Valve rotator
O-ring for valve guide	4	CDF21100	291	
O-ring for cylinder head	2	CDF21100	903	
O-ring for cylinder head cover	1	CDF21100	805	
O-ring for exhaust valve seat ring	4	CDF21100	118	
O-ring for DVT, P9	N/2	CDF24100	192	N : maximum cylinder No.
O-ring for DVT, D47.29	N/2	CDF24100	115	N : maximum cylinder No.

Parts description	Q'ty	Section No.	Item No.	Remark
-------------------	------	-------------	----------	--------

Cylinder head and cylinder liner

O-ring for DVT, G30	N/2	CDF24100	330	N : maximum cylinder No.
O-ring for DVT, G45	N/2	CDF24100	410	N : maximum cylinder No.
O-ring for cooling water jacket, G170	1	CDF15000	901	
O-ring for cooling water jacket, D180	1	CDF15000	902	
O-ring for cooling water connection, P50A	2	CDF15000	903	
O-ring for cooling water jacket, D230	1	CDF15000	907	
O-ring for cooling water jacket, D50.39	1	CDF15000	922	
O-ring for cooling water jacket, D53.57	1	CDF15000	923	
O-ring for cooling water jacket, D17.04	2	CDF15000	932	
O-ring for cooling water connection, P14	1	CDF15000	942	
O-ring for cooling water connection, P26	1	CDF15000	943	
O-ring for cooling water connection, P102	4	CDF78000	971	
Sealing ring for cylinder liner	1	CDF15000	191	
O-ring for cylinder liner, D312	1	CDF15000	192	
O-ring for cylinder liner, D317	1	CDF15000	193	

Piston and connecting rod

Piston pin	1	CDF31100	120	
Piston ring, top	1	CDF31100	151	
Piston ring, 2nd	1	CDF31100	152	
Piston ring, scraper	1	CDF31100	153	
Big end bearing, upper and lower	1	CDF32000	120	

Parts description	Q'ty	Section No.	Item No.	Remark
Piston and connecting rod				
Small end bush	1	CDF32000	130	
Connecting rod big end stud, M36	2	CDF32000	191	
Connecting rod shaft stud, M22	4	CDF32000	194	
Nut for connecting rod, M36	2	CDF32000	192	
Nut for connecting rod, M22	4	CDF32000	195	
Cylindrical pin	4	CDF32000	193	
Ignition system				
Fuel injection pump	1	CDF51000	100	
Fuel injection valve	N/2	CDF52000	100	N : maximum cylinder No.
Fuel high pressure block	1	CDF52300	100	
Micro pilot injector	N/2	CDF56002	201	N : maximum cylinder No.
VCV for pilot oil pump	1	CDF56002	201	
PCV for pilot oil pump	1	CDF56002	201	
O-ring for micro pilot injector	4	CDF56002	603	
O-ring for gas admission valve, D104	1	CDF53002	182	
O-ring for gas admission valve, D102	1	CDF53002	973	
O-ring for gas admission valve, D96	1	CDF53002	181	
Piping system				
Flexible connecting pipe, each type	1 set	C98370	-	
Lube oil filter cartridge	1 set	C63000	202	

The value(s) above is only provided preliminary information purpose, and these can be changed to be satisfied with the classification rules for each project and other reasons without any notice to improve engine.
In order to construct a commercial engine project, please contact HHI-EMD.

10.4 Heavy parts for maintenance

*Cylinder head and rocker arms assembly
(Weight : approx. 269kg)*

*Cylinder liner
(Weight : approx. 85 kg)*

*Water jacket
(Weight : approx. 125 kg)*

*Connecting rod shaft
(Weight : approx. 73 kg)*

Figure 10.1 Heavy parts dimension and weight.

Table 10.4 List of turbocharger outline dimension and weight

Turbocharger type	B	H	L	Weight (kg)	Remarks
A135	514	590	1074	270	Without insulation
A140	627	720	1311	460	Without insulation
A145	722	855	1566	750	Without insulation
ST4	516	527	1080	293	Without insulation
ST5	610	690	1320	384	Without insulation
ST6	742	853	1570	582	Without insulation

10.5 List of standard tools

Table 10.5 List of standard tool parts

Tool description	Q'ty	Remark
Cylinder head and liner		
Lifting tool for cylinder head	1	
Fitting/removal device for valve conical clamping piece	1	
Grinding tool for cylinder head and liner	1	
Extract/suspension device for cylinder liner	1	
Cylinder bore gauge	1	
Removing device for flame ring	1	
Removal device for valve seat	1	
Lapping device for inlet and exhaust valve seat	1	
Air gun for roto cap	1	
Feeler gauge for inlet and exhaust valve.	1	
Plier for locking ring	1	
Piston and connecting rod		
Guide bush for piston	1	
Lifting jig for piston	1	
Holding piece for crank pin bearing	2	
Suspension device for connecting rod	2	
Guide support for connecting rod	1	
Turning bracket for connecting rod	1	
Clamping support for connecting rod	2	
Plier 125 for piston pin locking ring	1	
Piston ring opener	1	

Tool description	Q'ty	Remark
Crankshaft and main bearing		
Lifting device for main bearing cap	4	
Fitting device for main bearing	1	
Deflection gauge for crankshaft	1	
Fuel injection valve		
Test tool for fuel valve nozzle	1	
Lapping device for injection valve bush	1	
Removal tool for atomizer nut	1	
Cleaning tool for fuel valve nozzle	1	
Removal device for fuel injection valve	1	
Long socket for nozzle nut	1	
Removal device for fuel injection valve bush	1	
Fitting device for micro pilot injector bush	1	
Removal device for micro pilot injector bush	1	
Cylinder pressure sensor tools		
Installation for cylinder pressure sensor	1	
General tools		
Spanner 3/4 for turning gear	1	
Extension bar for turning gear	1	
Extension bar 20	1	
Removal device for cooling water connection	1	
Hydraulic tools		
Hydraulic tightening devices M39	4	

Tool description	Q'ty	Remark
Hydraulic tools		
Hydraulic tightening devices M36	2	
Hydraulic tightening devices M22	2	
Set of spare parts for hydraulic tools M39	1	
Set of spare parts for hydraulic tools M36	1	
Set of spare parts for hydraulic tools M22	1	
Angle piece for hydraulic jack M22 x 1.5	2	
Support for hydraulic tools M39 (main bearing)	2	
Support for hydraulic tools M39 (cylinder head)	4	
Support for hydraulic tools M36 (connecting rod)	2	
Support for hydraulic tools M36 (count weight, flywheel)	2	
Support for hydraulic tools M22 (connecting rod)	2	
Extension screw M39 (cylinder head)	4	
Extension screw M36 (flywheel, counter weight)	2	
Extension screw M22 (connecting rod)	2	
Distribution pieces 2-POT	1	
Distribution pieces 4-POT	1	
High pressure hose (L=550)	4	
High pressure hose (L=3000)	1	
Adapter for hydraulic handing pump	1	
Handle	1	

Tool description	Q'ty	Remark
Dual valve timing tools		
Assembly tool for dual valve timing	1	
Automation tools		
RS232 to USB optical isolator	1	
Gas admission valve controller	1	
MP injector controller pin remover	1	
MP injector controller pin insertation remover	1	
Standard tool box		
Spare and tool box	4	

11 Appendix 1 (Piping symbols)

No.	Symbol	Symbol designation	No.	Symbol	Symbol designation
General conventional symbols					
1.1		Pipe	1.5		Indicating and measuring instruments
1.2		Pipe with indication of direction of flow	1.6		High pressure pipe
1.3		Valves, gate valves, cocks and flaps	1.7		Tracing
1.4		Appliances	1.8		Enclosure for several components assembled in one unit
Pipes and pipe joint					
2.1		Crossing pipes, not connected	2.13		Blank flange
2.2		Crossing pipes, connected	2.14		Spectacle flange
2.3		Tee pipe	2.15		Bulkhead fitting water tight, flanged
2.4		Flexible pipe	2.16		Bulkhead crossing, non-water tight
2.5		Expansion pipe	2.17		Test piece with plug
2.6		Joint, Screwed	2.18		Orifice
2.7		Joint, flanged	2.19		Reducer
2.8		Joint, sleeve	2.20		Open drain and air vent
2.9		Joint, hose coupling	2.21		Orifice
2.10		Expansion joint with gland	2.22		Loop expansion joint
2.11		Expansion pipe	2.23		Snap-coupling
2.12		Cap nut			

No.	Symbol	Symbol designation	No.	Symbol	Symbol designation
Valves, gate valves, cocks and flaps					
3.1		Valve, straight	3.24		Cock, three-way, L-port in plug
3.2		Stop valve (needle valve)	3.25		Cock, three-way, T-port in plug
3.3		Shuttle valve	3.26		Cock, four-way, straight through in plug
3.4		Valve, Three-way	3.27		Cock, with bottom connection
3.5		Non-return valve	3.28		Cock, straight through with bottom connection
3.6		Flap, straight through	3.29		Cock, angle with bottom connection
3.7		Flap, angle	3.30		Cock, three-way, with bottom connection
3.8		Safety valve	3.31		Solenoid valve
3.9		Self-closing valve	3.32		3-way test valve
3.10		Quick-opening valve	3.33		Thermostatic valve
3.11		Quick-closing valve	3.34		Valve with test flange
3.12		Regulating valve	3.35		3-way valve with remote control (Actuator)
3.13		Angle valve	3.36		Non-return valve (Air)
3.14		Ball valve	3.37		Reducing valve
3.15		Butterfly valve	3.38		3/2 way valve, normally open
3.16		Gate valve	3.39		3/2 way valve, normally closed
3.17		Double-seated changeover valve	3.40		2/2 way valve, normally open
3.18		Suction valve chest	3.41		2/2 way valve, normally closed
3.19		Suction valve chest with non-return valves	3.42		
3.20		Double-seated changeover valve, straight	3.43		
3.21		Double-seated changeover valve, angle	3.44		
3.22		Ball valve, angle	3.45		

No.	Symbol	Symbol designation	No.	Symbol	Symbol designation
-----	--------	--------------------	-----	--------	--------------------

Control and regulating part

4.1		Hand-operated	4.10		Electric motor driven
4.2		Remote control	4.11		Air motor driven
4.3		Spring	4.12		Manual override (At pneumatic valve)
4.4		Mass	4.13		Push button
4.5		Float	4.14		Spring
4.6		Piston	4.15		Solenoid
4.7		Membrane	4.16		Solenoid and pilot directional valve
4.8		Electro-magnetic	4.17		By plunger or tracer
4.9		Flame arrestor			Pneumatic

Appliances

5.1		Mudbox	5.13		Heat exchanger
5.2		Filter	5.14		Strainer
5.3		Duplex filter	5.15		Air filter
5.4		Magnetic filter	5.16		Air filter with manual control
5.5		Separator	5.17		Air filter with automatic drain
5.6		Steam trap	5.18		Water trap with manual control
5.7		Centrifugal pump	5.19		Air lubricator
5.8		Gear-or screw pump	5.20		Silencer
5.9		Hand pump (Bucket)	5.21		Fixed capacity pneumatic motor with spring returned
5.10		Ejector	5.22		Single acting cylinder with spring returned
5.11		Various accessories (Text to be added)	5.23		Double acting cylinder with spring returned
5.12		Piston pump	5.24		Auto drain trap

No.	Symbol	Symbol designation	No.	Symbol	Symbol designation
-----	--------	--------------------	-----	--------	--------------------

Fittings

6.1		Funnel	6.8		Air pipe with pressure-vacuum valve
6.2		Bell-mouthed pipe end	6.9		Deck fittings for sound's or filling pipe
6.3		Air pipe	6.10		Short sounding pipe with self-closing cock
6.4		Air pipe with net	6.11		Stop for sounding rod
6.5		Air pipe with cover	6.12		Oil tray coaming
6.6		Air pipe with cover and net	6.13		Bearing
6.7		Air pipe with pressure-vacuum valve	6.14		Water jacket

Reading instruments with ordinary symbol designations

7.1		Sight flow indicator	7.4		Distance level indicator
7.2		Observation glass	7.5		Counter (Indicate function)
7.3		Level indicator	7.6		Recorder

12 Appendix 2 (Instrumentation code)

*Refer to standard location and text for instruments on the following page

Specification of letter code for measuring devices			
1st letter		Following letters	
F	Flow	A	Alarm
L	Level	C	Control
P	Pressure	D	Differential
S	Speed, Solenoid	E	Element
T	Temperature	H	High
U	Voltage	I	Indicating
V	Viscosity	L	Low
Z	Position	S	Switching, Stop
		T	Transmitting
		X	Failure
		V	Valve

Combustion gas system

- 25 Exhaust gas at cylinder outlet
- 26 Exhaust gas at turbocharger inlet
- 27 Exhaust gas at turbocharger outlet

Compressed air system

- 20 Air at turbocharger inlet
- 24 Charge air at engine inlet
- 40 Air starting valve
- 41 Air stop valve
- 42 Turbocharger speed / Instrument air
- 45 Slow turn valve
- 46 Micro switch for turning gear / VVT valve
- 47 Engine speed
- 48 Engine TDC

Fuel oil system

- 50 Main fuel oil at filter inlet
- 51 Main fuel oil at engine inlet
- 51 Main fuel oil at engine outlet
- 52 Main fuel actuator
- 54 Leakage alarm tank
- 55 Pilot fuel at filter inlet
- 56 Pilot fuel at engine inlet
- 57 Pilot fuel pump
- 58 Pilot fuel valve
- 59 Pilot fuel pressure relief valve

Lubricating oil system

- 61 Lubricating oil at filter inlet
- 62 Lubricating oil at engine inlet
- 63 Lubricating oil at turbocharger inlet
- 63 Lubricating oil at turbocharger outlet
- 64 Lubricating oil pump
- 68 Level in base frame
- 92 Oil mist detector

Cooling water system

- 71 Low temperature water at air cooler inlet
- 72 Low temperature water at air cooler outlet
- 75 High temperature water at engine inlet
- 76 High temperature water at engine outlet

Gas system

- 80 Main gas at GRU filter inlet
- 81 Main gas at GRU filter outlet
- 82 Main gas at engine inlet
- 83 GRU control air
- 84 Main gas shut off valve at GRU
- 85 Gas venting valve at GRU
- 87 Main gas pipe on engine
- 88 Degasing valve at gas pipe on engine
- 90 Inert gas valve at GRU

This page is intentionally blanked

13 Note

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.
